PUBLISHERS' NOTE ON THE COMPLETED WORK

WITH the publication of the Atlas which is incorporated in the present edition The Century Dictionary and Cyclopedia has been brought to completion. As the Cyclopedia of Names grew out of the Dictionary and supplemented it on its encyclopedic side, so the Atlas has grown out of the Cyclopedia, and serves as an extension of its geographical material. Each of these works deals with a different part of the great field of words,—common words and names,—while the three, in their unity, constitute a work of reference which practically covers the whole of that field. The total number of words and names defined or otherwise described in the completed work is about 450,000.

The special features of each of these several parts of the book are described in the Prefaces which will be found in the first, ninth, and tenth volumes. It need only be said that the definitions of the common words of the language are for the most part stated encyclopedically, with a vast amount of technical, historical, and practical information in addition to an unrivaled wealth of purely philological material; that the same encyclopedic method is applied to proper names—names of persons, places, characters in fiction, books—in short, of everything to which a name is given; and that in the Atlas geographical names, and much besides, are exhibited with a completeness and serviceableness seldom equaled. Of The Century Dictionary and Cyclopedia as a whole, therefore, it may be said that it is in its own field the most complete presentation of human knowledge—scientific, historical, and practical—that exists.

Moreover, the method of distributing this encyclopedic material under a large number of headings, which has been followed throughout, makes each item of this great store of information far more accessible than in works in which a different system is adopted.

The whole represents fifteen years of labor. The first edition of The Century Dictionary was completed in 1891, and that of The Century Cyclopedia of Names in 1894. During the years that have elapsed since those dates each of these works has been subjected to repeated careful revisions, in order to include the latest information, and the results of this scrutiny are comprised in this edition.

KEY TO PRONUNCIATION.

a as in fat, man, pang.

 ū as in far, father, guard.
 â as in fall, talk, naught.
 â as in ask, fast, ant.
 â as in fare, hair, bear.

e as in met, pen, bless.
 ē as in mete, meet, meat.
 é as in her, fern, heard.

 tube, duty: see Preface, pp. ix, x).
 ũ as in pull, book, could.
 ü German ü, French n.

oi as in oil, joint, boy.
 ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. See Preface, p. xi. Thus:

ā as in prelate, courage, captain.
 ē as in ablegate, episcopal.
 ô as in abrogate, eulogy, democrat.
 ū as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *u*-sound (of but, pun, etc.). See Preface, p. xi. Thus:

ā as in errant, republican.
 ē as in prudent, difference.
 î as in charity, density.
 ū as in valor, actor, idiot.

ā as in Persia, peninsula.
 ē as in *the* book.
 ū as in nature, feature.

A mark (◡) under the consonants *t*, *d*, *s*, *z* indicates that they in like manner are variable to *ch*, *j*, *sh*, *zh*. Thus:

t as in nature, adventure.
 d as in arduous, education.
 s as in pressure.
 z as in seizure.

th as in thin.
 th as in then.
 ch as in German ach, Scotch loch.
 n French nasalizing n, as in ton, en.
 ly (in French words) French liquid (mouillé) l.
 ' denotes a primary, " a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read *from*; i. e., derived from.
 > read *whence*; i. e., from which is derived.
 + read *and*; i. e., compounded with, or with suffix.
 = read *cognate with*; i. e., etymologically parallel with.

✓ read *root*.
 * read *theoretical* or *alleged*; i. e., theoretically assumed, or asserted but unverified, form.
 † read *obsolete*.

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus:

back¹ (bak), *n*. The posterior part, etc.
 back¹ (bak), *a*. Lying or being behind, etc.
 back¹ (bak), *v*. To furnish with a back, etc.
 back¹ (bak), *adv*. Behind, etc.
 back^{2†} (bak), *n*. The earlier form of *bat*.
 back³ (bak), *n*. A large flat-bottomed boat, etc.

Various abbreviations have been used in the credits to the quotations, as "No." for *number*, "st." for *stanza*, "p." for *page*, "l." for *line*, ¶ for *paragraph*, "fol." for *folio*. The method used in indicating the subdivisions of books will be understood by reference to the following plan:

Section only § 5.
 Chapter only xiv.
 Canto only xiv.
 Book only iii.

Book and chapter	} iii. 10.
Part and chapter	
Book and line	
Book and page	
Act and scene	
Chapter and verse	} II. 34.
No. and page	
Volume and page	
Volume and chapter	
Part, book, and chapter	
Part, canto, and stanza	} II. iv. 12.
Chapter and section or ¶	
Volume, part, and section or ¶ I. i. § or ¶ 6.	
Book, chapter, and section or ¶ I. i. § or ¶ 6.	

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discrimi-

nated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.

The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [*cap.*] for "capital" and [*l. c.*] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoological and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoology, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoological and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

salsify (sal'si-fi), *n.* [Also *salsify*; = Sp. *salsifi* = Pg. *sersifim* = Sw. *salsifi*, < F. *salsifis*, dial. *sercifi*, OF. *sercifi*, *sercifi*, < It. *sassefrica*, goat's-beard, < L. *saxum*, a rock, + *fricare*, rub; see *friction*. Cf. *sassaparilla*.] A plant, *Tragopogon porrifolius*. It is extensively cultivated as a vegetable, the long fusiform root being the esculent part. Its flavor has given rise to the name of *oyster-plant* or *vegetable oyster*. Also *purple goat's-beard*. See cut on preceding page.—**Black salsify**, *Scorzonera Hispanica*, a related plant with a root like that of salsify but outwardly blackish. It is similarly used, and its flavor is preferred by some.

salsilla (sal-sil'i), *n.* [< Sp. *salsilla*, dim. of *salsa* (= Pg. It. *salsa*), sauce; see *sauce*.] A name of several plants of the genus *Bomarea*, yielding edible tubers. *B. edulis* is cultivated in the West Indies, its root being eaten like the potato; it is diaphoretic and diuretic. Other species, as *B. salsilla*, are natives of the Peruvian Andes, and are pretty twining plants with showy flowers.

salso-acid (sal'sō-ā'id), *a.* [< L. *salsus*, pp. of *salire*, salt, salt down, + *acidus*, acid.] Having a taste both salt and acid. [Rare.]

salsoda (sal-sō'dā), *n.* Crystalline sodium carbonate. See *sodium carbonate*, under *sodium*.

Salsola (sal'sō-lā), *n.* [NL. (Linnaeus, 1737), < L. *salsus*, pp. of *salire*, salt, salt down, < *sal*, salt; see *sauce*.] 1. A genus of apetalous plants of the order *Chenopodiaceæ*, type of the tribe *Salsolæ*. It is characterized by a single orbicular and horizontal seed without albumen, containing a green spiral embryo with elongated radicle proceeding from its center, by bisexual axillary flowers without disk or stamens, and with four or five concave and winged perianth-segments, and by unjointed branches with alternate leaves. There are about 10 species, mainly natives of Europe, northern Africa, and temperate and tropical regions of Asia; 10 are found in South Africa; one, *S. Kali*, is native on sea-beaches not only in Europe and western Asia, but in North and South America and Australia, also sparingly inland in the United States. They are herbs or shrubs, either smooth, hairy, or woolly, and bearing sessile leaves, often with a broad clasping base, sometimes elongated, sometimes reduced to scales, and often prickly-pointed. The small greenish flowers are solitary or clustered in the axils, and commonly persistent and enlarged about the small rounded utricular fruit. Various species are called *saltwort*, and *prickly glasswort*, also *kelpwort*.

Prickly Saltwort (*Salsola Kali*).

2. [l. c.] A plant of this genus.

salsolaceous (sal-sō-lā'shins), *a.* [< NL. *Salsola* + *-aceus*.] Of or pertaining to or resembling the genus *Salsola*.

It is getting hopeless now: . . . sand and nothing but sand. The *salsolaceous* plants, so long the only vegetation we have seen, are gone.

H. Kingsley, Geoffrey Hamlyn, xlii.

Salsolæ (sal-sō-lā'ē), *n. pl.* [NL. (Moquin-Tandon, 1835), < *Salsola* + *-æ*.] A tribe of chenopodiaceous plants, typified by the genus *Salsola*. It embraces twenty other genera, chiefly natives of the temperate parts of the Old World.

salsuginose (sal-sū'ji-nōs), *a.* [< ML. *salsuginosus*, salty; see *salsuginous*.] In bot., growing in places inundated with salt water.

salsuginous (sal-sū'ji-nus), *a.* [Also *salsuginose*; < ML. *salsuginosus*, salty; < L. *salsuga* (also *salsilago*) (-gin-), saltiness; < *salsus*, pp. of *salire*, salt, < *sal*, salt; see *salt*.] Saltish; somewhat salt. [Rare.]

The distinction of salts, whereby they are discriminated into acid, volatile, or *salsuginous*, if I may so call the fugitive salts of animal substances, and fixed or alkaline, may appear of much use in natural philosophy. Boyle.

salt¹ (sält), *n.* and *a.* [I. *n.* < ME. *salt*, *scalt*, < AS. *sealt* = OS. *salt* = MD. *saut*, D. *zout* = MLG. *salt*, *solt*, LG. *solt* = OHG. MHG. G. *salt* = Icel. *salt* = Sw. Dan. *salt* = Goth. *salt* = W. hallt (Lapp. *sallte*, < Scand.), salt; appar. with the formative -t of the adj. form. II. *a.* < ME. *salt*, < AS. *sealt* = OFries. *salt* = MLG. *salt* = Icel. *salt* = Sw. Dan. *salt*, salt, = L. *salsus*, salted. The name in other tongues is of a simpler type: L. *sal* (> It. *sale* = Sp. *Pr. sal* = F. *sel*) = Gr. *âz* = OBulg. *sol* = Sery. Pol. *sol* = Bohem. *sol* = Russ. *sol* = Lett. *sāls* = W. hal. *halen* = Ofr. *salon*, salt. Hence, from the L. form, sal. *salu*¹, *salary*, *saline*, *salmagundi*, *salter*³ (salt-cellar), *saltmeter*, *sauce*, *sansage*, *souse*, etc.] I. *n.* 1. A compound (NaCl) of chlorine with the metallic base of the alkali soda, one of the most abundantly disseminated and important of all substances. It not only occurs in numerous localities in beds sometimes thousands of feet in thickness, but also exists in solution in the ocean, forming nearly three per cent. by weight of its mass. It is not only of the greatest

importance in connection with the business of chemical manufacturing, but is also an indispensable article of food, at least to all men not living exclusively on the products of the chase. Salt often occurs crystallized, in the isometric system, and has when crystalline a perfect cubic cleavage. Its specific gravity is about 2.2. When pure it is colorless. As it occurs in nature in the solid form, it is almost always mixed with some earthy impurities, besides containing more or less of the same salts with which it is associated in the water of the ocean (see *ocean*). It is not limited to any one geological formation, but occurs in great abundance in nearly all the stratified groups. The Great Salt Range of India is of Lower Silurian age; the principal supply of the United States comes from the Upper Silurian and Carboniferous; the most important salt-deposits of England, France, and Germany are in the Permian and Triassic; the most noted deposits of Spain are Cretaceous and Tertiary; and those of Poland and Transylvania are of Tertiary age. Salt is obtained (1) from evaporation of the water of the ocean and of interior saline lakes; (2) from the evaporation of the water rising naturally in saline springs or obtained by boring; (3) by mining the solid material, or rock-salt. The supply of the United States is chiefly obtained by evaporating the water rising in holes made by boring. The principal salt-producing States are Michigan, New York, Ohio, Louisiana, West Virginia, Nevada, California, and Kansas; it is also produced in Utah. The two first-named states furnished in 1897 about three-quarters of the total product of the United States. The salt of California is made by the evaporation of sea-water; that of Utah from the water of Great Salt Lake; that of Louisiana and of Kansas, in part, is obtained by mining rock-salt. The product of the other States named comes chiefly from the evaporation of brine obtained by boring. Salt is of great importance as the material from which the alkali soda (carbonate of soda) is manufactured, and thus may be properly considered as forming the basis of several of the most economically important branches of chemical manufacture. Salt is also an article of great historical and ethnological importance. By many nations of antiquity it was regarded as having peculiar relations to mankind. Homer calls it "divine." It has been and is still used as a measure of value.

Lay salt on the trencher with knife that be cleve;
Not to myche, he thou were, for that is not gode.

Booke of Precedence (E. E. T. S., extra ser.), i. 60.

Then, when the languid flames at length subside,
He strows a bed of glowing embers wide,
Above the coals the smoking fragments turns,
And sprinkles sacred salt from lifted urns.

Pope, *Ilad*, ix. 282.

Abandon those from your table and salt whom your own or others' experience shall deservy dangerous.

Ep. Hall, Epistles, i. 8.

2. In *chem.*, any acid in which one or more atoms of hydrogen have been replaced with metallic atoms or basic radicals; any base in which the hydrogen atoms have been more or less replaced by non-metallic atoms or acid radicals; also, the product of the direct union of a metallic oxide and an anhydride. (J. P. Cooke, Chem. Phil., p. 110.) The nomenclature of salts has reference to the acids from which they are derived. For example, *sulphates*, *nitrites*, *carbonates*, etc., imply salts of sulphuric, nitric, and carbonic acids. The termination *-ate* implies the maximum of oxygen in the acids, and *-ite* the minimum.

3. *pl.* A salt (as Epsom salts, etc.) used as a medicine. See also *smelling-salts*.—4. A marshy place flooded by the tide. [Local.]—5. A salt-cellar. [Now a trade-term or colloq.]

Garnish'd with salts of pure beaten gold.

Middleton, *Micro-Cynicon*, i. 3.

I out and bought some things: among others, a dozen of silver salts.

Pepys, *Diary*, II. 165.

6. In *her.*, a bearing representing a high decorative salt-cellar, intended to resemble those used in the middle ages. In modern delineations this is merely a covered vase.—7. Seasoning; that which preserves a thing from corruption, or gives taste and pungency to it.

Ye are the salt of the earth. Mat. v. 13.

Let a man be thoroughly conscientious, and he becomes the salt of society, the light of the world.

J. F. Clarke, *Self-Culture*, p. 216.

8. Taste; smack; savor; flavor.

Though we are justices and doctors and churchmen,
Master Page, we have some salt of our youth in us.

Shak., *M. W. of W.*, ii. 3. 50.

9. Wit; piquancy; pungency; sarcasm; as, Attie salt (which see, under *Attie*).

On wings of fancy to display

The flag of high invention, stay,

Repose your quills; your veins grow four,

Tempt not your salt beyond her pow'r;

If your pall'd fancies but decline,

Censure will strike at every line.

Quarles, *Emblems*. (Varies.)

He says I want the tongue of Epigrams;

I have no salt. B. Jonson, *Epigrams*, xlv.

They understood not the salt and ingenuity of a witty and useful answer or reply.

Jer. Taylor, *Works* (ed. 1855), I. 741.

10. Modification; hence, allowance; abatement; reserve; as, to take a thing with a grain of salt (see phrase below).

Contemporary accounts of these fair damsels are not very good, but it was rather a libellous and scurrilous age as regards women, and they might not be true, or at all events be taken with much salt.

J. Ashton, *Social Life in Reign of Queen Anne*, I. 135.

11. A bronzing material, the chlorid or butter of antimony, used in bronzing gun-barrels and other iron articles.—12. Lecherious desire.

Gifts will be sent, and letters which
Are the expressions of that itch
And salt which frets thy suters.

H. crick, *The Parting Verse*.

13. A sailor, especially an experienced sailor. [Colloq.]

My complexion and hands were quite enough to distinguish me from the regular salt, who, with a sunburnt cheek, wide step, and rolling gait, swings his bronzed and toughened hands athwart-ships, half-opened, as though just ready to grasp a rope.

R. H. Dana, Jr., *Before the Mast*, p. 2.

The Samaritans must . . . have derived their Pentateuch from the Jews after Ezra's reforms, i. e. after 444 B. C. Before that time *Samaritanism* cannot have existed in a form at all similar to that which we know.

The consequences which an action done here may have in the unseen world are the sanctions attached to it. *Hodgson, Phil. of Reflection, III. xi. § 6.*

External sanction, the knowledge of a fact in the external world which will result from an act either always or in the long run, and so produce pleasure or pain, as an inducement to do or refrain from that sort of act. — **Internal sanction**, the knowledge of mental reflection upon an act, productive of pleasure or pain, as an inducement to do or refrain from that sort of act. — **Legal sanction**, the knowledge that a penalty will probably be inflicted by a court for an act, as an inducement to refrain from that act. — **Moral sanction**, according to Bentham, the knowledge of how one's neighbors will take a given act, as a motive for doing or not doing it. Less strict utilitarians, as Mill, admit an internal sanction as moral. Non-utilitarian moralists often use the phrase *moral sanction*, but with no determinate signification. Thus, the intuitionist Calderwood (Handbook of Moral Philos., I. ii. 4, § 7) says: "Sanction is a confirmation of the moral character of an action, which follows it in experience."

This makes *sanction* in this phrase mean not a reward or punishment, but an attestation. On the other hand, the evolutionist Stephen (Science of Ethics, X. i. 2) says: "According to my argument, the primary and direct incidence, if I may say so, of *moral sanctions* is upon the social organism, whilst the individual is only indirectly and secondarily affected." That is to say, races in which certain instincts are weak are unfitted to cope with other races, and go under; so that a *moral sanction* is a remote consequence of a line of behavior tending by natural selection to reinforce certain instincts. — **Physical sanction**, the knowledge that pleasure or pain will generally result from a given line of conduct by the operation of causes purely natural. — **Political sanction**, the hope of favor or fear of hostility on the part of a government as the consequence of, and thus a motive for or against, certain conduct. — **Popular sanction**, the knowledge that the people, in their private and individual capacity, will regard with favor or disfavor a person who acts in a given way, as a motive for or against such action. Bentham regards this as the same as *moral sanction*. — **Pragmatic sanction**. See *pragmatic*. — **Psychological sanction**, the knowledge that certain conduct, if found out, will act upon a certain mind or certain minds to cause those persons to confer pleasure or inflict pain upon the person who pursues such conduct, this knowledge being considered as a motive for or against that conduct. — **Punitive sanction**, the attachment of a penalty to a legal offense. — **Religious sanction**, the belief that God attaches rewards and punishments to his laws as a motive for obeying him. — **Remuneratory sanction**, the promise, as by a government, of a reward as an inducement to attempt a certain performance. — **Social sanction**. Same as *popular sanction*. = *Syn. 1 and 3.* Authorization, countenance, support, warrant.

It. santuario, < LL. sanctuarium, a sacred place, a shrine, a private cabinet, ML. also temple, church, churchyard, cemetery, right of asylum, < L. sanctus, holy, sacred: see saint.] 1. A sacred or consecrated place; a holy spot; a place in which sacred things are kept.

Proverbs, like the sacred books of each nation, are the sanctuary of the intuitions. *Emerson, Compensation.*

Specifically — (a) In *Script.*, the temple at Jerusalem, particularly the most retired part of it, called the *holy of holies*, in which was kept the ark of the covenant, and into which no person was permitted to enter except the high priest, and that only once a year to intercede for the people. The same name was given to the corresponding part of the tabernacle in the wilderness (Ex. xxv. 9). (b) A house consecrated to the worship of God; a church.

And I saw crowds in column'd sanctuaries.

Tennyson, Fair Women.

(c) The cella or most sacred part of an Egyptian, Greek, or Roman temple. (d) In *classical antiqu.*, a sacred place, a locality, whether inclosed or not, but generally inclosed, consecrated to some divinity or group of divinities, often a grove, sometimes an inclosure of notable size and importance, containing shrines, temples, a theater, arrangements for gymnastic contests, places of shelter for suppliants or for the sick, etc.; as, the sanctuary of Esculapius at Epidaurus.

Seintuary, churchyard. The name of sanctuary is now given to that part of the choir or chancel of a church where the altar stands. In mediæval documents belonging to this country, Sanctuarium and its equivalents in English almost always mean churchyard.

Note in *Myrc's Instructions for Parish Priests* (E. E. T. S.), p. 75.

2. A place of refuge or protection; a sacred asylum; specifically, a church or other sacred place to which is attached the privilege of affording protection from arrest and the ordinary operation of the law to criminals, debtors, etc., taking refuge within its precincts. From the time of Constantine downward certain churches have been set apart in many Catholic countries to be an asylum for fugitives from the hands of justice. In England, particularly down to the Reformation, any person who had taken refuge in such a sanctuary was secured against punishment — except when charged with treason or sorcery — if within the space of forty days he gave signs of repentance, and subjected himself to banishment. By the act 21 James I., c. xxviii., the privilege of sanctuary for crime was finally abolished. Various sanctuaries for debtors, however, continued to exist in and about London till 1837, when they too were abolished. In Scotland the abbey of Holyrood House and its precincts still retain the privilege of giving sanctuary to debtors, and one who retires thither is protected for twenty-four hours; but to enjoy protection longer the person must enter his name in the books kept by the bailie of the abbey. Since the abolition of imprisonment for debt this sanctuary is no longer used.

The place abounded with desperadoes of every description — bankrupt citizens, ruined gamblers, irreclaimable prodigals. *Scott, Fortunes of Nigel, xvi.*

3. Refuge; shelter; protection; specifically, the immunity from the ordinary operations of law afforded by the sacred character of a place, or by a specially privileged church, abbey, etc.

Sanctus (sang'k-tus), *n.* [So called from the first word in the *L.* version; *< L. sanctus*, pp. of *sanctus*, make holy, consecrate; see *sanct*.] 1. In *liturgies*, the ascription "Holy, holy, holy, Lord God of hosts, . . ." in which the eucharistic preface culminates, and which leads up to the canon or prayer of consecration. The *Sanctus* exists and occupies this place in all *liturgies*. It is probably of primitive origin, and was already, as it still is, used in the Jewish liturgy (being taken from *Isa. vi. 2, 3*; compare *Rev. iv. 8*), the following "Hosanna" (*Psalm cxviii. 25*, "save now") also further marking the connection. A similar ascription occurs in the Te Deum. Other names for the *Sanctus* are the *Tersanctus* and, improperly, the *Trisagion*, and the *Seraphic or Triumphal Hymn* (*Epiphany*). See *Benedictus*, *preface*.

2. A musical setting of the above ascription or hymn.—**Black Sanctus**, a profane or burlesque hymn, performed with loud and discordant noises; hence, any confused, tumultuous uproar. Also *Black Sanctus*, *Sanctos*, *Santis*.

sand¹ (sand), *n.* [*< ME. sand, sand, < AS. sand = OS. sand = OFries. sand = MD. sand, D. sand = MLG. sant, LG. sand = OHG. MHG. sand, G. sand = Icel. sandr = Sw. E. dial. *samcl, gritty, sandy*, and *L. sabulum* (for **samulum* ?), sand, gravel.] 1. Water-worn detritus, finer than that to which the name *gravel* would ordinarily be applied; but the line between sand and gravel cannot be distinctly drawn, and they frequently occur intermingled. Sand consists usually of the debris of crystalline rocks, and quartz very commonly predominates in it, since this mineral is very little liable to chemical change or decomposition. In regions of exclusively calcareous rocks there is rarely any considerable amount of what can be properly called sand, finely comminuted calcareous materials being extremely liable to become re-consolidated. Sand occurs in every stage of wear, from that in which the particles have sharp edges, showing that they have been derived from the recent breaking up of granite and other silicious rocks, to that in which the fragments are thoroughly rounded, showing that they have been rubbed against one another during a great length of time. Sand, when consolidated by pressure or held together by some cement, becomes sandstone; and a large part of the material forming the series of stratified rocks is sandstone.

The counter, shelves, and floor had all been scoured, and the latter was overstrewn with fresh blue sand.

Hawthorne, Seven Gables, ii.

Sandstone: so used in the Pennsylvania petroleum region, where the various beds of petro-liferous sandstone are called *oil-sands*, and designated as first, second, third, etc., in the order in which they are struck in the borings. The most important species is *S. album*, an evergreen 20 or 30 feet high, with the aspect of privet. It is native in dryish localities in southern India, ascending the mountains to an altitude of 3,000 feet. The heart-wood is yellowish-brown, very hard and close-grained scented with an oil still more abundant in the root, which is distilled for perfumery purposes and is in great request. The wood is much used for carving, making ornamental boxes, etc., being valued as a protective from insects as well as for its perfume. It is also extensively used, especially in China (which is the great market for sandalwood), to burn as incense, both in temples and in dwellings. Other sandalwoods, from which for a time after their discovery large supplies were obtained, are *S. Freycinetianum* (its wood called *citron* or *yellow sandalwood*) and *S. pruriarium* of the Hawaiian Islands, *S. Faisi* of the Fijis, *S. Austro-caledonicum* of New Caledonia, and *Fusanus* (*Santalum*) *spicatus* of Australia, but these sources were soon nearly exhausted. sand-jet (sand'jet), *n.* An apparatus whereby sharp sand is fed to a jet of compressed air or a steam-jet, and driven out forcibly against a surface which it is desired to abrade. It has within a few years been extensively applied to the ornamentation of glass, and to some extent in the operations of stone-cutting and the smoothing and cleaning of cast-iron hollow ware. In the ornamentation of glass, stencils are placed upon the surface, which protect from abrasion the parts covered, and the abraded parts take the form of the pattern cut in the stencil. A very short exposure to the sand-jet produces the tracing of the pattern in a fine-frosted, well-defined figure. The effectiveness of the jet when air or steam at high pressure is used renders it competent to cut and drill even corundum. The results attained, when the simplicity of the means employed are considered, render this one of the most interesting of modern inventions. See *sand-blast*.

sandpiper (sand'pä'pér), *n.* 1. A small wading bird that runs along the sand and utters a piping note; a sand-lark, sand-plover, or sand-shipe. Technically (a) A bird of the family *Scelopacidae*, subfamily *Scelopacinae*, and section *Tringae*, of which there are about 20 species, of all parts of the world. They have the bill like a true snipe's in its sensitiveness and constricted gape, but it is little if any longer than the head, straight or scarcely decurved, and the tail lacks the cross-bars of that of most snipes and tattlers. The toes are four in number (excepting *Calidris*), and cleft to the base (excepting *Microgalina* and *Ereunetes*). The sandpipers belong especially to the northern hemisphere, and mostly breed in high latitudes; but they perform the most ex-

tensive migrations, and winter in the tropics over the world. The sexes are alike, and the seasonal changes of plumage are slight. Sandpipers are probably without exception the most numerous of all birds. They live preferably in open water, sandy places, swamps and fens, and feed by probing with their sensitive bills like snipes. Among them are the most sensitive of waders, as the tiny sandpipers of the genus *Actodromas* called *stints*. The semipalmated sandpiper is larger, but has basal webs to its *longish* feet. In America, the spoon-billed sandpiper, *Leucrostris albigularis*, is another distinctive bird of the same family. The stilt-sandpiper has long legs and long palmed feet. It is *Microgalina himantopus*. The bill-billed sandpiper is *Limicola pumila* or *phalaropus*, and found in America. The peck-billed sandpiper of the same genus is *Actodromas maculata*, a characteristic American species.

(c) A band of the same family and subfamily as the foregoing, but of the section *Troglodytes*, or tattlers, several but not all of which are also known as sandpipers because they used to be put in the old genus *Tringa*. The common sandpiper of Europe, etc., is *Tringa* or *Actodromas hypoleucis*, of which the common peewee or spotted sandpiper of the United States, *T. pusillus*, is a close ally. This form is used in caissons for sinking bridge-foundations, and is sometimes called a *sand ejector*. It is a modification of the jet-pump. The water, passing upward around the upper end of the suction-pipe, produces an upward draft or suction on the mingled sand and water below, drawing it upward and discharging it through *d*.

sandstone (sand'stōn), *n.* [= *D. zandsteen* = *G. sandstein* = *Sw. Dan. sandsten*; as *sand* + *stone*.] A rock formed by the consolidation of sand. The grains composing sandstone are almost ex-

clusively quartz, this mineral resisting decomposition, and only becoming worn into finer particles as abrasion continues, while almost all other minerals entering into the composition of ordinary rocks are liable to dissolve and be carried away in solution, or be worn down into an impalpable powder, so as to be deposited as mud. Sandstones may contain also clayey or calcareous particles, or be cemented by so large a quantity of ferruginous or calcareous matter as to have their original character quite obscured. Hence varieties of sandstones are qualified by the epithets *argillaceous calcareous*, *ferruginous*, etc.—**Berea sandstone**, a sandstone or grit belonging to the Carboniferous series, extensively quarried as a building-stone and for grindstones in Ohio and especially in the vicinity of Berea (whence the name). **Caradoc sandstone**, a sandstone of Lower Silurian age, very nearly the geological equivalent of the Bala group in Merionethshire, Wales, and of the Trenton limestone of the New York geologists. The name was given by Murchison, from the locality of Cner Caradoc, in Shropshire, England.—**Flexible sandstone**. See *itacolumite*.—**Medina sandstone**, a red or mottled and somewhat argillaceous sandstone forming, according to the classification of the New York Survey, the base of the Upper Silurian series. It corresponds nearly to the Upper Llandovery of the English geologists. It is the "Levant" or No. IV. of the Pennsylvania Survey.

"A mountain of IV." is perhaps the commonest expression in American geology. These mountains are very numerous, being reiterated outcrops or reappearances and disappearances of the *Medina sandstone* as it rises and sinks in the Appalachian waves.

J. P. Lesley, *Coal and its Topography*, p. 59.

New Red Sandstone, a name formerly given in England to a great mass of strata consisting largely of red shales and sandstones and overlying rocks, belonging to the Carboniferous series. A part of the New Red Sandstone is now considered to belong to the Permian series, since the organic remains which it contains are decidedly Paleozoic in character. The upper division of these red rocks, although retaining to a very considerable extent the same lithological characters as the lower division, differs much from it in respect to the fossils it contains, which are decidedly of a Mesozoic type, and form a portion of the so-called Triassic series. The term *New Red Sandstone* is still used to some extent in England, and has been applied in the United States to the red sandstones of the Connecticut river valley, which are generally considered to be of Triassic age. See *Triassic*.—**Old Red Sandstone**, a name given in England, early in the history of geology, to a group of marls, sandstones, tilestones, and conglomerates seen over an extensive area, and especially in Herefordshire, Worcestershire, Shropshire, and South Wales, cropping out from under the coal-measures and resting on the Silurian. These rocks were called *Old Red*, to distinguish them from a somewhat similar series overlying the Carboniferous, and designated as the *New Red Sandstone*. The name *Beronian* was given later by Sedgwick and Murchison to rocks occurring in Devon and Cornwall and occupying a stratigraphical position similar to that of the Old Red, and the name *Beronian* is now in general use throughout the world as designating that part of the geological series which lies between the Silurian and the Carboniferous. The name *Old Red Sandstone* has, however, been retained by English geologists to designate that peculiar type of the Devonian which is less distinctively marine than the Devonian proper, and which is characterized by the presence of numerous land-plants and ganoid fishes, as well as by the absence of unequivocally marine organisms. The areas in which these deposits were laid down are generally considered to have been lakes or inland seas. The Old Red Sandstone, as thus limited, seems to have been almost exclusively confined to the British Isles; and it is particularly well developed in Scotland, and also is of considerable importance in Ireland.—**Oriskany sandstone**, the name given by the New York Geological Survey to a group of strata lying between the Lower Helderberg group and the Catskill grit, and considered by James Hall as forming the uppermost division of the Upper Silurian. In central New York it is chiefly a siliceous sandstone, but is sometimes argillaceous; it extends west as far as Missouri, becoming more calcareous. *Spirifer arrenurus* is a very characteristic fossil of this group over a wide area. It is No. XII. of the numerical designation of the Pennsylvania Survey, and the "Meridian" of H. D. Rogers's nomenclature.—**Pocono sandstone**, a very thick and persistent mass of sandstones and conglomerates underlying the Mauch Chunk Red Shale, and forming the base of the Carboniferous in Pennsylvania. It is No. X. of the numerical notation of the First Pennsylvania Survey, and the same as the "Vespertine" of H. D. Rogers.

The Pottsville conglomerate forms a rim around the coal basins, and the *Pocono sandstone* and conglomerate an outer rim, with a valley included between them eroded out of the Mauch Chunk red shale.

C. A. Ashburner, *Anthracite Coal-fields of Penn.*, p. 13.

Potsdam sandstone, in *geol.*, the lowest division of the Lower Silurian, and the lowest zone in which distinct traces of life have been found in the United States; so named by the geologists of the New York Survey from a town of that name in that State. The formation is a conspicuous and important one further west through the region of the Great Lakes. It is the equivalent of the Primordial of Barrore, and of the Cambrian or Cambro-Silurian of some geologists. Among the fossils which characterize this formation are certain genera of brachiopods (*Lingulella*, *Obolus*, *Orthis*, *Dicella*) and trilobites of the genera *Conocozyge* and *Paradozyge*. The Potsdam, Primordial, or Cambrian rocks have been variously subdivided in Europe and America within the past few years. Thus, the Canadian geologists call the lower section, as developed in Newfoundland, Nova Scotia, and New Brunswick, *Acadian*, and the overlying beds *Georgian*. In Nevada five divisions have been made out. The rocks thus designated, however, are paleontologically closely related; neither is there, in the opinion of most Continental geologists, any sufficient reason for separating the Cambrian, as a system, from the Silurian.—**St. Peter's sandstone**, a sandstone, from 60 to 100 feet in thickness, consisting of almost chemically pure siliceous material, which lies next above the so-called Lower Magnesian limestone in the upper Mississippi lead region,

and extends further to the north into Minnesota. It is almost entirely destitute of fossils, but from its stratigraphical position it is considered to be nearly of the same age as the Chazy limestone of the New York Survey.

sand-sucker (sand'suk'çer), *n.* 1. The rough dab, *Hippoglossoides limatoides*, also called *sand-fluke* and *sandwacker*. The name is due to the erroneous idea that it feeds on nothing but sand. *Day, Fishes of Great Britain and Ireland*, II, 10.

2. In the United States, a general popular name for soft-bodied animals which hide in the sand, sometimes exposing their suckers, tentacles, or other parts, as ascidians, holothurians, or nereids.

sand-swallow (sand'swol'ô), *n.* Same as *bank-swallow*.

sand-thrower (sand'thrô'er), *n.* A tool for throwing sand on sized or painted surfaces. It consists of a hollow handle in which a supply of sand is contained, and from which it passes into a conical or V-shaped box. The box ends in a narrow slit from which the sand issues, distributed by a projecting lip.

Sand-trap (in section).
F, cast iron body; E, cover; A, finely perforated diaphragm; D, induction port for water; C, valve. (Water enters through D, and the sand is collected in C.)
G, plug for clearing out sand.

sand-trap (sand'trap), *n.* In *hydraulic engine*, a device for separating sand and other heavy particles from running water. It consists substantially of a pocket or chamber in which the sand is collected by a sudden change in the direction of the flow, which causes the momentum of the particles to carry them out of the stream into the collecting chamber, or by a sudden reduction of velocity through an abrupt enlargement in the pipe or channel which conducts the stream, whereby the heavy particles are permitted to gravitate into the receiving-pocket, or by the use of a strainer which intercepts the particles and retains them, or by a combination of these principles.

sand-wasp (sand'wosp), *n.* A fossorial hymenopterous insect which digs in the sand; a digger-wasp, as of either of the families *Pompilidæ* and *Sphecidae*, and especially of the genus *Ammophila*. There are many species, and the name is a loose one. Some of these wasps belong to the *Scelidæ*; others, as of the family *Crabronidæ*, are also known as *sand-hornets*, and many are popularly called *sand-hugs*. The general distinction of these wasps is from any of those which build their nests of papery tissue, or which make their cells above ground. sanhedrim, **sanhedrin** (san'hê-drim, -drin), *n.* [= F. *sanhedrin* = Sp. *sanedrín* = Pg. *sanedrím*, *sinedrím* = It. *sinedrín* = G. *sanhedrín*, < late Heb. *sanhedrîn*, < Gr. *συνέδριον*, a council, lit. 'a sitting together,' < *σιν*, together, + *ιδρα*, a seat, = E. *settle*.] 1. The supreme council and highest ecclesiastical and judicial tribunal of the Jewish nation. It consisted of 71 members, composed of the chief priests, elders, and scribes, and held daily sessions, except on sabbaths and festivals; specifically styled the *great sanhedrim*, to distinguish it from the *lesser* or *provincial sanhedrim* of 23 members appointed by the great sanhedrim, and having jurisdiction over minor civil and criminal cases. Such lesser tribunals were set up in towns and villages having not fewer than 120 representative men, including a physician, a scribe, and a schoolmaster. The great sanhedrim is said in the Talmud to have had its origin in the appointment by Moses of 70 elders to assist him as magistrates and judges (Num. xi. 16). The Greek origin of the name, however, seems to indicate that the thing originated during the Macedonian supremacy in Palestine. The name was dropped under the presidency of Gamaliel IV. (A. D. 270-300), while the institution itself became extinct on the death of its last president, Gamaliel VI. (425).

Christian parliaments must exceed its religion and government of the sanhedrim.

The flowers are of moderate size or sometimes very long, and are clustered among dry bracts in a dense raceme on a tall and stout unbranched leafless flower-stalk. The 8 species are native from the East Indies to Australia and the Pacific Islands. They are smooth plants, bearing opposite or rarely alternate petioled coriaceous leaves, which are feather-veined, but with the midrib alone conspicuous. The juice or fluid which circulates in all plants, being as indispensable to vegetable life as is the blood to animal life. It is the first product of the digestion of plant-food, and contains the elements of vegetable growth in a dissolved condition. The absorption of nutriment from the soil is effected by the minute root-hairs and papillae, the absorbed nutriment being mainly composed of carbonic acid and nitrogenous compounds dissolved in water. This ascending sap, or as it is termed *crude sap*, is apparently transmitted through the long cells in the vascular tissue of the stem and branches to the leaves, passing from cell to cell by the process known as *imbosmose*. In the leaves is effected the process of digestion or assimilation, with the following results: (1) the chemical decomposition of the oxygenated matter of the sap, the absorption of carbon dioxide (carbonic acid), and the liberation of pure oxygen at the ordinary atmospheric temperature; (2) a counter-operation by which oxygen is absorbed from the air, and carbon dioxide exhaled; (3) the transformation of the remaining crude sap into organic substances which enter into the composition of the plant: this change is effected in the chlorophyll-cells of the leaves under the influence of light, and the assimilated sap, or as it is termed *elaborated sap*, descends through the branches and stem to the growing parts of the plant requiring the same, there to be used up, after undergoing a series of changes included under the name *metabolism*, or to form deposits of reserve material lodged in various parts for future use. The ascent of the sap is one of the most wonderful phenomena of spring, and apparently depends not so much on the state of the weather—for it begins in the depth of winter—as on the plant having had its sufficient term of rest, and being, therefore, constrained by its very nature to renewed activity. Hence—2. The juice or fluid the presence of which in anything is characteristic of a healthy, fresh, or vigorous condition; blood.

The flowers have usually four or five imbricated and unequal sepals, three, four, or five imbricated petals, eight stamens inserted within the disk, and a three-celled ovary, becoming in fruit capsular or indehiscent, a drupe, berry, or nut, or composed of two or three wing-fruits. As recently revised by Radlkofe, the order includes about 950 species, and is most abundant in the tropics, with only a few genera in temperate regions. The 122 genera are included in 14 tribes. The species are usually tall trees, with a watery juice, and in the tropics bear evergreen alternate abruptly pinnate leaves, generally with small flowers without odor and with inconspicuous colors. For prominent genera, see *Sapindus* (the type), *Paullinia*, *Kolreuteria*, and *Nephelium*. The well-known genera *Acer*, *Eucalyptus*, and *Staphylea* now pass respectively into the orders *Aceraceae*, *Hippocastanaceae*, and *Staphyleaceae*. See *Sapindales*, and cuts under *Kolreuteria*, *Negundo*, and *Sapindus*.

The leaves are usually compound, and the flowers polygamously dioecious. According to the latest revisions, it includes 7 orders—the *Aceraceae*, *Hippocastanaceae*, *Meliastaceae*, and *Staphyleaceae*, formerly regarded as suborders of the *Sapindaceae*, being now erected into independent orders.

lar disk, solitary ovules, and a fruit of one or two oblong or globose nutlets, each containing a single globose seed without an aril. There are about 40 species, natives of the tropics of both hemispheres, mostly trees, sometimes climbing shrubs. They bear alternate leaves, which are undivided, or are abruptly pinnate with several entire leaflets, or are reduced to a single leaflet. The flowers form terminal or axillary racemes or panicles. All the species, and several specifically, are known as *soapberry*. See *soapberry*; also *whit china-tree*, under *china-tree*.

Diet.); but no such Celtic word is found.] A genus of apetalous plants of the order *Euphorbiaceae*, tribe *Crotonaceae*, and subtribe *Hippomaneae*. It is characterized by spiked or racemed flowers which are commonly glandular-bracted, by two free stamens, and by a capsule which at length opens loculicidally, but long afterward retains its seeds persistent on a three-winged columella. There are about 25 species, widely scattered through most warm regions. They are trees or shrubs, with alternate petioled leaves, which are usually entire and glandular at the base. *S. Laurecerasus*, var. *ellipticum* (*S. laurifolium*), is the Jamaica milkwood or gum-tree, a middle-sized tree with shining leaves, abounding in an annoying milky juice. *S. biglandulosum*, of which there are many varieties, yields in the West Indies a gum like caoutchouc, and in Paraguay a tan-bark. The East Indian *S. indicum* has a milky-stinging juice; its leaves afford in Borneo, where it is called *boroo*, a dye and a stain for ratan, and its young fruit is acid and eaten as a condiment, though the fruit is said to be used as a poison for alligators.

1. Atlantic Sardine (*Clupea pilchardus*)

other is the Spanish sardine, *C. pseudohispanica*, found from Cuba to Florida, and related to the former, but having a strongly striate operculum. In the French preparation of sardines these delicate fish are handled as fresh as possible, to which end the factories are usually within two or three hours from the place where the fish are caught. Placed on stone tables, the fish are headed and gutted; they are then allowed to drain on wooden slats overnight, after being slightly salted. Next day they are salted again, and allowed to dry. They are then cooked in oil, and put in wire baskets to drip. The cooking is a nice process; if it is overdone the scales come off, which impairs the market value. Five or six minutes suffices for the cooking. When cold the fish are placed on tables, to be arranged in the boxes, in oil dipped from barrels. The oil being worth more than the fish, bulk for bulk it is an object to fill the boxes as closely as possible with fish. The boxes are then

soldered and afterward steamed, being placed in cold water on which steam is gradually turned. This second cooking takes an hour or more. The boxes are then allowed to cool in the water, and care is taken to move them as little as possible. In a cheaper method the sardines are first cooked in an oven without oil, the after-process being the same as before. As the fish are migratory, a shoal sometimes remains at a fishing station only a week. The season of catching and canning lasts three or four months, from May to August. Small sardines are most prized. Large coarse fish put up in the United States are sardines, under the name of *shadines*, are young menhaden.

When the sardine increasing of the sea cometh, there cometh also therewith such a multitude of the sardine fishes called *sardines* that . . . no man wold beleve it that hath not seen it.

The weed has also been called in E. *grapeweed* and *tropical grapes*.] Same as *gulfweed*. The *Sargasso Sea* is a region occupying the interior of the great gyration of the Gulf Stream in the North Atlantic, so named from the abundance in it of this weed (*Sargassum bacciferum*), which in some parts is so dense as to be a serious hindrance to navigation. It covers a large part of the space between the 16th and 38th parallels of north latitude, and the seaweed is most dense between the 30th and 50th meridians. By extension the name is sometimes used with reference to other less important areas of floating seaweed. See *Sargassum*.

The floating islands of the gulf-weed, with which we had become very familiar as we had now nearly made the circuit of the *Sargasso Sea*, are usually from a couple of feet to two or three yards in diameter, sometimes much larger; we have seen on one or two occasions fields several acres in extent, and such expanses are probably more frequent nearer the centre of its area of distribution.

This genus is the most highly organized of the *Fucales*, and contains about 150 species, which inhabit the warmer waters of the globe, *S. bacciferum* being the well-known gulfweed which floats in the open sea in great abundance and has given the name to the Sargasso Sea. sasin (sas'in), *n.* [F. Ind.] The common Indian antelope, *Antelope cervicapra* or *A. bezoartica*, remarkable for its swiftness and beauty.

Sasin, or Indian Antelope (*Antelope cervicapra*).

It is abundant in the open dry plains of India, in flocks of from ten to sixty females to a single male. It will clear from 25 to 30 feet at a bound, and rise even 10 or 11 feet from the earth. It is grayish-brown or black on the upper parts of the body, with white abdomen and breast, and a white circle round the eyes. It stands about 2 feet 6 inches high at the shoulder. This is the animal which is considered to represent the modern restricted genus *Antelope*, from which many more have been successively detached for other and very numerous *Antilopina* of Asia and Africa. Its usual specific name is not to be confounded with the same word used in a generic sense for the very different African bohor. The *sasin* is among several antelopes loosely called *ghazel*. It has long been known as a source of bezoar, as indicated by one of its specific names. The record of the *sasin*, in its relations to man, goes back to the dawn of history; for it is the animal with the straight corkscrew horns so commonly figured on the monuments of Assyria and Babylonia. In India it is usually figured drawing the car of Chandra, the moon-god, and furnishes a probable prototype of the animals with which the classic huntress Diana is associated. It is there also a regular attribute of Siva, or Mahadeva, held by the hind legs upright in one of the hands of this god, and connected with *linga*-worship, apparently from its reputed salacity.

withers, and its horns are gently curved rather than abruptly bent. It is one of the group of large bubaline antelopes of which the blesbok is another, but the sassaby lacks the white blaze on the face. (Compare cut of blesbok.) The horns are about a foot long. The animal is much hunted both for its hide and for its flesh, and has been thinned out in countries where it formerly abounded. It inhabits by preference open places, sometimes in herds of several hundreds.

A tree, the only species of the genus *Sassafras*. It is common in eastern North America, in the south taking possession, along with the persimmon, of abandoned fields. It reaches a height of about 45 feet. Its wood is light and soft, coarse-grained, not strong, but very durable in contact with the soil, used for fencing, in cooperage, etc. The root, especially its bark, enters into commerce as a powerful aromatic stimulant, and is much used in flavoring and scenting, an oil being distilled in large quantities for the latter purposes. The bark is officinal, as also the pith, which affords a mucilaginous application and a drink. An early name in England was *ague-tree*.

[They] did helpe vs to dig and carry *Sassafras*, and doe any thing they could, being of a comely proportion and the best condition of any Salvages we had yet encountered.

Quoted in *Capt. John Smith's Works*, I, 107.

The only species *S. officinale*, is a native of the United States, especially southward and principally east of the Mississippi, extending also into Canada. It is a small or middle-sized tree, with aromatic bark and roots, and remarkable for the green color of its flowers, bud-scales, and branches, and for its dimorphous leaves, the earlier entire and oval, the later three-lobed or irregular. 3. In *geom.*, a straight line bearing the following relation to another straight line. The satellite (also called the *satellite line*) of a given straight line, with reference to a given cubic curve in whose plane the straight line lies, is the straight line joining the three points at which the three tangents to the curve at the points of intersection of the first straight line with it again cut the curve. This is the definition of Cayley (*Phil. Trans.*, 1857, p. 416), but it has the inconvenience that according to it every satellite line has two, four, or six primaries, while each primary has but a single satellite. For this reason, it might be well to interchange the applications of *primary* and *satellite* in the theory of plane cubics. In the diagram, ABC is the satellite line.

Nodal Cubic, with Four Primary Lines and their Satellite

From its intersections with the cubic curve tangents are drawn to the latter, AD, AE, BF, BG, CH, CI. The points of tangency lie three by three on four primary lines, FDB, DGI, EGH, FII. The intersections of these with the satellite line are called the *satellite points*. Two are near H. The others are not shown.

5. To fulfil the conditions of; answer; as, an algebraical equation is said to be *satisfied* when, after the substitution of particular expressions for the unknown quantities which enter it, the two members are equal.—**Syn. 1. Content, Satisfy, Satisfate, Sate, Satisfice, Satisfy**. To content a person is to give him enough to keep him from being disposed to find fault or repine; to *satisfy* him is to give him just the measure of his desires (see *contentment*); to *satisfate* him is to give him so much that he cannot receive, desire, or enjoy more, and would be disgusted at the idea of more; to *satisfice* him is to give him more than enough; to *satisfy* him is to fill him to the point of loathing; *sate* is the same as *satisfate*, but less popular and more rhetorical. The last four words of the list are applied primarily to food.

The Planet Saturn, with its Ring

Julian years and 167 days, its synodical 378 days. The eccentricity of the orbit is considerable, the greatest equation of the center being 6.1. Owing to the fact that the period of Saturn is very nearly 2½ times that of Jupiter, these planets exercise a curious mutual influence, analogous to that of one pendulum upon another swinging from the same support. Since 1790, when in consequence of this influence Saturn had lagged 50 behind and Jupiter had advanced 20 beyond the positions they would have had if undisturbed, Saturn has been moving continually faster, and the whole period of the inequality is 929 years. This is the largest perturbation of those affecting the motions of the principal bodies of our system. Saturn is the greatest planet except Jupiter, its diameter being about 9 times, its volume 697 times, and its mass 33.0 times that of the earth. Its mean density is 0.7, water being unity. Gravity at the surface has 1 the intensity of terrestrial gravity. It is evident that we see only the atmosphere of Saturn. Its albedo is 0.5, about that of a cloud; but its color is decidedly orange. It shows some bands and spots upon its surface which are not constant. The compression of the spheroid of Saturn exceeds that of every other planet, amounting to 1/3 of its diameter. Its rotation, according to Professor Asaph Hall, is performed in 10h 14.4m. Its equator is nearly parallel to that of the earth. After the discovery by Galileo of the four satellites of Jupiter, Kepler conjectured that Mars should have two, and Saturn six or nine moons. In fact, Saturn has nine moons, as follows (the distances from the planet being given in thousands of miles):

Name.	Mag.	Dist.	Period.	Discoverer.	Date.
		d. h. m. s.			
Mimas	12.8	114	22 36 17	W. Herschel	1789
Enceladus	12.3	147	1 8 53	W. Herschel	1789
Tethys	11.4	181	1 21 18	D. Cassini	1684
Dione	11.5	232	2 17 41	D. Cassini	1684
Rhea	10.8	325	4 12 25	D. Cassini	1672
Titan	9.4	754	15 22 41	D. Huygens	1655
Hyperion	13.7	912	21 6 39	S. G. Bond	1848
Iapetus	11.8	2193	79 7 54	D. Cassini	1671
Phoebe	15.5			W. H. Pickering	1898

Saturn was regarded by astrologers as a cold, dry, and melancholy planet, and was called the *greater infatuate*. The symbol of Saturn is ♄, representing probably a scythe. For its attendant ring, see below.

3t. In *alchemy and old chem.*, lead.—**4.** In *her.*, a tincture, the color black, when blazoning is done by means of the heavenly bodies. See *blazon*, n. **2.**—**Balsam of Saturn**, line of Saturn, mount of Saturn, salt of Saturn. See *balsam*, line 2, etc.—**Saturn red**, red lead. **Saturn's ring**, an apparent ring around and near the planet Saturn. It consists of three apparent rings lying in one plane. The innermost is dusky and pretty transparent. In contact with it is the brightest ring, called ring B, and between this and the outermost, called ring A, is a gap. Other divisions have been observed at different times, but they do not appear to be constant. The following are the dimensions in statute miles:

Diameter of Saturn	75,800
Distance from surface of Saturn to dusky ring	5,000
Breadth of dusky ring	11,200
Breadth of ring B	17,900
Width of division	1,800
Breadth of ring A	11,700
Total diameter of ring	172,800

The thickness of the ring is considerably less than a hundred miles. Its plane is inclined 7° to the planet's equator and 28° 10' to the earth's orbit. When Saturn appears in the hind legs of Leo or the water of Aquarius, we see the rings edgewise, and they pass out of sight, remaining invisible as long as the sun shines upon the side away from us, for the ring only shows by the reflected light of the sun. They are best seen when the planet is in Taurus or Scorpio. As soon as Saturn was examined with a telescope (by Galileo), it was seen to present an extraordinary appearance; but this was first recognized and proved to be a ring by Huygens in 1659. In 1673 J. D. Cassini saw the separation between rings A and B, which is hence called the Cassinian division. (It has also been erroneously called Ball's division.) The dusky ring was discovered in 1850 at Cambridge, Massachusetts, by G. P. Bond. The ring was first assumed to be solid. Laplace showed that, upon that assumption, it must be upheld by the attractions of the satellites. B. Peirce in 1851 demonstrated the ring to be fluid—that is, to consist of vast numbers of particles, or small bodies, free to move relatively to one another. This had been suggested by Rømer in the seventeenth century. See cut on preceding page.—**Saturn's tree**, the popular name for an arborescent deposit of lead from a solution of lead acetate by electrochemical action.

In this sense it contains only about a dozen species, nearly all Old World. *S. pyri* and *S. pavonia* are two notable European species.

Pope, *Dunciad*, iv. 16.

2. Of or pertaining to the planet Saturn.—**Saturnian meter** or *verse*, a form of verse used in early Roman poetry before the adoption of Greek meters. A number of examples of this meter are extant in citations, inscriptions, etc., but recent metricians are by no means agreed as to its true nature. Some explain it as quantitative, and describe the classic example

Dābunt mālum Metēlli [or Metēlli] || Navio pōctē

as an iambic line consisting of two members (cola) separated by a cesura. Such a verse was compared by Macaulay (Intro. to "Lays of Ancient Rome") to the nursery rhyme

Thē quēn | wās in | hēr pār | lōur || ēating | brēad and | hōney.

Others (and this is now the prevalent opinion) regard the Saturnian verse as purely accentual:

Hence—**2.** [l. c.] Morose; dull; heavy; grave; not readily susceptible to excitement or cheerfulness; phlegmatic.

with small horns upon the forehead, and a tail like that of a horse or a goat, and they frequently hold a thyrsus or wine-cup. Late Roman writers confused the satyrs with their own fauns, and gave them the lower half of the body of a goat. Satyrs were common attendants on Bacchus, and were distinguished for lasciviousness and riot. In the authorized version of the Old Testament (Isa. xlii. 21; xxxiv. 14) the name is given to a demon believed to live in uninhabited places and popularly supposed to have the appearance of a he-goat (whence the name). The Hebrew word *śā'ir*, plural *śā'irim*, so translated in these passages, means 'shaggy' as an adjective, and 'he-goat' as a noun. From the idolatrous worship of goats, the name came to be applied to demons. In Lev. xvii. 7 and 2 Chron. xi. 15 it is translated 'devil.'

Various other etymologies, all absurd, have been suggested or are current, namely: (*b*) *< F. sainte terre, holy land*, in supposed allusion to "idle people who roved about the country and asked charity under pretence of going *à la sainte terre*," to the holy land. (*c*) *< F. sans terre, without land*, "applied to wanderers without a home"; (*d*) *< F. sentier, a footpath (see sentinell, sentry)*; (*e*) *< D. slenteren = Lt. slenderen = Sw. slentra = Dan. slentre, saunter, loiter, Sw. slunta = Dan. slunte, idle, loiter; leel. slentr, idle lounging, slen, sloth, etc.*; (*f*) *< leel. seint = Norw. seint = Sw. Sauria (sā'ri-i), *n. pl.* [NL., *< Gr. sauros, a lizard*; see *Saurus*.] An order of reptiles, having scales and usually legs, named by Bronnigart in 1799, and corresponding closely to the Linnean genus *Lacerta*; lizards. The name has been used with various extensions and restrictions of its original sense, in which it included the crocodiles and alligators as well as the true lizards or lacertilians, thus corresponding to the two modern orders *Lacertilia* and *Crocodylia*. In Cuvier's classification *Sauria* were the second order of reptiles, extended to include not only the living lizards and crocodiles, but also the extinct representatives then known of several other modern orders, as pterodactyls, ichthyosaurs, and plesiosaurs. On these accounts the term *Sauria* is discarded by many modern writers; by others it is used in a restricted sense for the lizards proper without the crocodiles, being thus an exact synonym of *Lacertilia*. This is a proper use of the name, near its original sense, and the term has priority over *Lacertilia*. The *Sauria* in this sense are about 1,500 species, representing from 20 to 25 families and numerous genera. Formerly also *Saura*, *Sauræ*.

II. *n.* A member of the *Sauria*, in any sense; a scaly reptile with legs, as a lacertilian or lizard. Though the term *Sauria* once lapsed from any definite signification, in consequence of the popular application of Cuvier's loose use of the word, *saurian* is still used as a convenient designation of reptiles which are not amphibians, chelonians, ophidians, or crocodilians. See *cut* under *Plesiosaurs*.

The species are extinct, but formed a considerable contingent of the fishes of the Mesozoic formations from the Liassic and Jurassic beds. In the flicker's skull here figured from nature is found a condition of things that fairly answers to Parker's description, subsisting mainly in the presence of a pair of stunted vomers separate from each other; but the like state of the parts does not appear in several other woodpeckers' skulls examined in the preparation of this paragraph.

'a cutter' (cf. *OHG. sch, MHG. sech, seche*, *G. sech*, a plowshare, *AS. sythre, sithe*, *E. sithe*, misspelled *scythe*, lit. 'a cutter'), < *✓ say*, cut, = *L. secare*, cut (whence ult. *E. sickle*): see *sectant, section*.] **1. A** cutting-tool consisting of a metal blade, band, or plate with the edge armed with cutting teeth, worked either by a reciprocating movement, as in a hand-saw, or by a continuous motion in one direction, as in a circular saw, a band-saw, and an annular saw. Saws are for the most part made of tempered steel. The teeth of the smaller kinds are formed by cutting or punch-

ing in the plate interstitial spaces or gullets. In saws of large size inserted or removable teeth are now much used. Small saws are generally provided with a single handle of hard wood; larger saws, for use by two workmen, have a handle at each end. Reciprocating saws move generally have their teeth inclined toward the direction of their cutting-stroke (see *rake*, *n.* 1), but some cut in both directions equally. To cut freely, saws must have, for most purposes, what is called *set*—that is, alternate teeth must be made to project somewhat laterally and uniformly from opposite sides of the saw in order that the kerf or saw-cut may be somewhat wider than the thickness of the saw-blade. This prevents undue friction of the sides of the blade against the sides of the kerf. Some saws, however, as surgeons' saws, back-saws, etc., have little or no set, and undue friction against the kerf is prevented by making the blades of gradually decreasing thickness from the edge toward the back.

2. A saw-blade together with the handles or frame to which the blade is attached, as a hand-saw, wood-saw, or back-saw.—**3. In** *zool.* and *compar. anat.*, a serrated formation or organ, or a serrated arrangement of parts of formations or organs. (*a*) The set of teeth of a manganer, as *Mergus serrator*. (*b*) The serrate tomial edges of the beak of any bird. See *sawbill, serratorate*. (*c*) The long flat serrate or dentate snout of the saw-fish. See cut under *Pristis*. (*d*) The ovipositor of a saw-fly (*Tenthredo*).

4. A sawing-machine, as a scroll-saw or jig-saw.—**5. The** act of sawing or sawing; specifically, in *whist* [U. S.], same as *see-saw*, 3 (*b*).—

Annular saw. (*a*) A saw having the form of a hollow cylinder or tube, with teeth formed on the end, and projecting parallel to the longitudinal axis of the cylinder, around which axis the saw is rotated when in use. Also called *barrel-saw, crown-saw, cylinder-saw, drum-saw, ring-saw, spherical saw, and tub-saw*. See cut under *crown saw*. (*b*) In *surg.*, a trephine.—**Brier-tooth saw**, a saw gulletted deeply between the teeth, the gullets being shaped in a manner which gives the teeth a curvature resembling somewhat the prickles of briars (whence the name). This form of tooth is chiefly used in circular saws, rarely or never in reciprocating saws. Also called *gullet-saw*.—**Butcher's saw** [named after R. G. Butcher, a Dublin surgeon], a narrow-bladed saw set in a frame so that it can be fastened at any angle: used in resections.—**Circular saw**, a saw made of a circular plate or disk with a toothed edge, either formed integrally with the plate, or made by inserting removable teeth, the latter being now the most approved method for teeth of large lumber-cutting saws. Circular saws are very extensively used for manufacturing lumber, and their cutting power is enormous, some of them being over 7 feet in diameter, running with a circumferential velocity of 9,000 feet and cutting at the rate of 200 feet of kerf per minute. From the nature of this class of saws, they are exclusively used in sawing-machines. These machines, for small saws, are often driven by foot- or hand-power, but more generally by steam, water, or animal-power. Plain circular saws can cut only rectilinear kerfs, but some circular saws have a dish or concavo-convex form, by which curved shapes corresponding with the shape of the saw may be cut. See cut under *rim-saw*.—**Comb-cutters' saw.** Same as *comb-saw*.—**Cross-cut saw.** (*a*) A saw adapted by its filing and setting to cut across the grain. The teeth are filed to act more nearly like knife-points than those of rip-saws, which act more like chisels. Cross-cut saws have a wider set than rip-saws. (*b*) Particularly, a saw used by lumbermen for cutting logs from tree-trunks, having an edge slightly convex in the cutting-plane, a handle at each end projecting from and at right angles with the back in the plane of the blade, and teeth filed so that the saw cuts when drawn in either direction. It is operated by two workmen, one at each handle.—**Double saw**, two parallel saw-blades working together at a specific distance from each other, and in cutting leaving a piece of specific thickness between their kerfs.—**Endless saw.** Same as *band-saw*.—**Equalizing saw**, a pair of circular saws placed on a mandrel and set at any desired distance apart by a gage: used for squaring off the ends of boards, etc.—**Hack-saw**, a small stout frame-saw with little set, close teeth, and well tempered: used for sawing metal, as in cutting off bolts, nicking heads of hand-made screws, etc.—**Half-back saw**, a hand-saw the back of which is stiffened to a distance of half the length of the blade from the handle.—**Half-rip saw**, a hand-saw without a back, and having a width of set intermediate between that of a cross-cut saw and that of a rip-saw.—**Hay's saw**, a small two-edged saw set in a short handle: one edge is straight, the other convex. It is used in removing pieces of bone from the skull.—**Interosseous saw.** See *interosseous*.—**Perforated saw**, a saw having a series of perforations behind the teeth.—**Pitch of a saw.** See *pitch*.—**Pit frame-saw**, a double frame-saw, worked by hand, to the frame of which are attached upper and lower cross-handles analogous to those used on the ordinary pit-saw.—**Railway cut-off saw**, a circular saw or buzz-saw supported on its frame upon a carriage moving on a track, so that it can be fed backward and forward to its work.—**Reversible saw**, a straight-edged saw having both edges armed with teeth, so that cutting can be done with either edge, at will, by reversing the saw.—**Smith's saw**, a hack-saw.—**To be held at the long saw**, to be kept in suspense.

Between the one and the other he was held at the long saw above a month.

saw-fly (sá'flí), *n.* A hymenopterous insect of
the family *Phaenididae*, so called from the
peculiar construction of the ovipositor (saw or
terebra), with which they cut or pierce plants.
Two plates of this instrument have serrate or toothed
edges. The turnip-saw-fly is *Meloida centipedia*; the goose-
berry saw-fly, *Neomatus grossulariae*; the sweet-potato saw-
fly, *Schizoceros cheimicus*; the wheat or corn saw-fly, *Cephus
pennatus*; the rose saw fly, *Monolegia* (or *Hyalodonta*) *rosa*;
the willow saw fly, *Neomatus centricornis*. The pear slug is
the larva of *Scandelia cerasi*. The wheat or corn saw-fly
is exceedingly injurious to wheat and rye, the female de-
positing her eggs in the stalk, which the larva destroys.
It is about half an inch long. The Scotch saw fly is a mem-
ber of the genus *Lophoceros*. See cuts under *Hyalodonta*,
Lyda, *rosae-lutea*, and *Scandelia*.

In the case of the *Lath-saw-fly* (*Neomatus erichsonii*,
Hartig), the two sets of serrated blades of the ovipositor
are thrust obliquely into the shoot by a sawing movement;
the lower set of blades is most active, sliding in and out
alternately, the general motion of each set of blades being
like that of a back-saw.

machine in which the work remains stationary, and the
saw travels over it.

saw-jointer (sá'join'tér), *n.* An apparatus by
which the jointing of gang-saws (that is, the
filing and setting of the teeth) is performed with
proper allowance for change of shape resulting
from unequal strains in the saw-gate, so that
parallelism of the breast-line and rake may be
secured when the saws are put under tension.
The main features of the apparatus are a guiding frame
for holding the saw during the operation of jointing,
which moves upon adjustable ways in such manner as to
gage the filing of the teeth so that their points will lie in
the arc of a circle of considerable radius. Saws so jointed
may have the tension adjusted in the gate in a manner
that will secure the straight breast line and uniform rake
necessary for uniformity in their action in the gang.

saw-tooth (sā'tōth), *n.* A tooth of a saw. Saw-teeth are made in a great variety of forms; typical shapes are shown in the cuts.

Forms of Removable Saw-teeth.

If designed to cut in one direction only, they are given a rake in that direction. If they are to cut equally in either direction, the teeth are generally V shaped, their central axes being then at right angles with the line of cut. Teeth of saws are either formed integrally with the plates or blades, or inserted and removable. The latter have the advantage that they can be replaced easily and quickly when worn or broken, and the need of gumming is entirely obviated. The method is, however, practicable only with the teeth of large saws.—**Saw-tooth indicator**, an adjustable device used in shaping the teeth of circular saws to insure their filing and setting at equal distances from the center.—**Saw-tooth swage**, an anvil-block used with a punch or wedge to flatten the edges of saw-teeth. The details of construction are such that the tone is remarkably full and even, the compass very long, and the fingering consistent and simple. Six or more sizes or varieties are made, so as to form a complete series or family of similar tone and manipulation; they are named by their fundamental key or by their relative compass, as soprano, tenor, etc. The tenor saxhorn is also called *alt-horn*; the next larger, *baritone*; the next, *euphonium*; and the bass, *baritone* or *sax-tuba*. These instruments are especially useful for military bands, but they have not been often introduced into the orchestra, because of the comparatively unsympathetic quality of the tone. It is characterized by a two-celled ovary maturing into a small two-beaked and two-celled many-seeded pod, with the placentae in the axis, and by flowers with a five-lobed calyx, five equal petals, and ten stamens, with slender filaments and two-celled anthers. There are about 180 species, chiefly natives of cold regions, especially high mountains and in arctic latitudes, chiefly of the northern hemisphere, rare in South America and in Asia. They are usually perennials, with a radical rosette of broad leaves, and varying in habit from erect to prostrate, and from very smooth to glandular-hairy. Their flowers are small, but of conspicuous numbers, usually white or yellow, and panicle or corymbose. About 50 species are found in North America, nearly half of which occur also in the Old World; excluding Alaska, 30 species are known within the United States, natives especially of mountains of New England and Colorado, only 3 descending into the plains, and but 1 in the mountains south of North Carolina. They increase rapidly northward, and 25 or more are reported from Alaska, 9 of which extend to its most northern limit, Point Barrow, at 71° 27'. *S. oppositifolia*, the purple saxifrage, is perhaps the most characteristic and widely distributed plant of the arctic regions, where it is almost universal, and often the first flower to bloom, producing from four to nine pink or dark-purple petals, ranging from sea-level to 1,500 feet, and extending from northern Vermont to the farthest north yet reached, 83° 24'. See *saxifrage*.

Saxifragaceae (sak si-frā-gā'sē-ē), *n. pl.* [NL. (A. P. de Candolle, 1830), < *Saxifraga* + -aceae.] An order of polypetalous plants, the saxifrage family, belonging to the cohort *Rosales* in the series *Calyciflorae*. It is closely allied to the *Rosaceae*, but with usually only five or ten stamens, and is characterized by the usual presence of regular flowers with five sepals, five petals, free and smooth filaments, two-celled anthers, a swollen or divided disk, and an ovary of two carpels, often separate above and containing numerous ovules in two rows at the central angle. It includes about 650 species in 87 genera of 6 tribes, natives of north temperate and especially of frigid regions, rare in the tropics and south temperate zone. It exhibits great variety in habit. In the shrubby genera and trees the leaves are generally opposite; in the others alternate, and often chiefly radical. Many produce valued fruits, as the currant and gooseberry; in others the fruit is a dry capsule. Many are cultivated for their ornamental flowers. See *Hydrangea*, *Deutzia*, *Philadelphus*, *Heuchera*, and *Saxifraga* (the type of the family); also *Ribes*², *Ceanothus*, *Escallonia*, *Francoa*, the types of tribes; and, for American genera, *Itea*, *Mitella*, *Parsonsia*, and *Tiarella*. Thy Wars on Land, thy Triumphs on the Main?

did not come into use before the beginning of the
xvi. century, and seems to have commenced in France.

Lock, *Church of our Fathers*, III. i. 339.

4. To call; declare or suppose to be.

Bycause every thing that by nature falls down is said

take for granted; often in an imperative form,
in the sense of "let us say," "we may say," "we
shall say": as, the number left behind was not
great, say only five.

What other pleasure can the world afford?

regarding.

What say you to a letter from your friends?

Shak., *T. G. of V.*, ii. 4. 51.

= **Syn.** *Say, Speak, Tell, State*. Each of these words has
its peculiar idiomatic uses. We *say* an oration, and *tell*
a story, but do not *say* either of them. We *say* prayers or
a lesson, but do not *say* or *tell* them, although the one
praying may *tell* his beads. *Say* is the most common word
before a quotation direct or indirect: Adam said, "This
is now bone of my bones" (Gen. ii. 23); "If we *say* that we
have no sin, we deceive ourselves" (1 John i. 8). *Tell* is
often exactly synonymous with *say*; as, *tell* (say to) him
that I was called away. *Speak* draws its meanings from the
idea of making audible; *tell*, from that of communicating.
Tell is the only one of these words that may express a
command. *State* is often erroneously used for simply *say*;
as, he *stated* that he could not come; *state* always
implies detail, as of reasons, particulars; to *state* a case
is to give it with particularity.

II. *intrans.* 1. To speak; declare; assert;
express an opinion; as, so he says.

"O Kynde Priam," quod they, "thus *sayen* we."

For the other part of the imputation, of having said so
much, my defence is, that my purpose was to say as well
as I could.

The tube of the oblique corolla is split down behind to the base, the lobes spreading and unappendaged; there are five stamens with free anthers, and a two-celled ovary with one ovule in each cell, becoming in fruit an indehiscent drupe with the stone woody or bony. Obstructions technically known as *scaffolds* occur not unfrequently in blast furnace working, and are often a source of considerable trouble.

2. To lay or place on a scaffold; particularly, to place (dead bodies) on a scaffold to decay or be eaten by birds, as is customary with some uncivilized tribes.

A grand celebration, or the Feast of the Dead, was solemnly convoked. Not only the remains of those whose bodies had been *scaffolded*, but of all who had died on a journey, or on the war-path, and been temporarily buried, were now gathered together and interred in one common sepulchre with special marks of regard.

D. Wilson, Prehistoric Man, xxi. (*Encyc. Dict.*)

scaglia (skal'yā), *n.* [It., a scale, a chip of stone, etc.: see *scale*¹.] The local name in parts of the Italian Alps of a limestone of various colors, and of different geological ages. The typical scaglia is a reddish argillaceous limestone with a decidedly conchoidal fracture. This rock is of Jurassic age; but there is an upper scaglia which is of the age of the Upper Cretaceous.

scagliola (skal-yō'lā), *n.* [Also *scaliola*; < *It. scagliuola*, dim. of *scaglia*, a scale: see *scale*¹.] In *arch.*, an Italian process for imitating stone, used for enriching columns and internal walls of buildings. It is an application of stucco consisting essentially of a mixture of plaster with glue. The plaster employed must be as pure and white as possible. Various colors are given to it by a mixture of metallic oxides. To

imitate different kinds of marble, the colors are mixed with the paste. Breccias are imitated by introducing fragments of colored stucco; granites and porphyries in the same way, and also by cutting into the stucco and filling the cavities with a paste having the color of the crystals it is desired to imitate. Sometimes the stucco is put upon the wall with a brush, as many as twenty coats being applied. It is then roughly polished, and the cavities and defective places filled up; and this is done over and over, until the surface has attained the desired perfection; a finer polish is then given.

So was [thrown open] the double door of the entrance-hall, letting in the warm light on the scagliola pillars, the marble statues, and the broad stone staircase, with its matting worn into large holes. *George Eliot, Felix Holt, i.*

In *zool.* and *anat.*, one of three cavities of the cochlea, in man and other mammals winding spirally around the modiolus or columella of the ear, as a spiral staircase winds around the newel: in lower vertebrates much simplified.—3. [*cap.*] In *conch.*, an old generic name of wentletraps: same as *Scalaria*. *Klein, 1753.*—**Scala media**, the middle passage of the spiral canal of the cochlea, separated from the scala vestibuli by the membrane of Reissner and from the scala tympani by the basilar membrane, and containing upon its floor the organ of Corti. It terminates at both apex and base in a blind pointed extremity, but is continuous through the canals reniens, near its basal extremity, with the sacculus of the vestibule. Also called *canalis membranaceus* and *cochlear duct* or *canal of the cochlea*; the latter two terms, however, are sometimes restricted to mean respectively the passage between the tectorial membrane and the basilar membrane and the one between the tectorial membrane and the membrane of Reissner.—**Scala tympani**, that part of the spiral canal of the cochlea which is on the under side of the spiral lamina, and is separated from the scala media by the basilar membrane. It communicates with the scala vestibuli at the apex of the modiolus, and is separated from the tympanum, in the recent state, by the membrane covering the fenestra rotunda.—**Scala vestibuli**, one of the three passages of the spiral canal of the cochlea, separated from the cochlear canal by the membrane of Reissner. It begins at the vestibule, and communicates at the apex of the modiolus with the scala tympani. Also called *reticular passage*.

scalar (skā-lār), *n.* and *a.* [*< L. scalaris*, of or pertaining to a ladder or a flight of steps, *< scala, scalae*, a ladder, flight of steps: see *scale*.] *Cf. scalary.* 1. *n.* In quaternions, a real number, positive or negative, integral, fractional, or surd: but some writers lately extend the meaning so as to include imaginaries. Sir W. R. Hamilton introduced the word with the meaning "a real number"; and it tends to confuse the subject to use a word needed for one purpose to signify something else for which no new word is needed.—**Scalar of a quaternion**, a scalar which, being subtracted from the quaternion, leaves a vector as the remainder.

II. *a.* Of the nature of a scalar.—**Scalar function**, see *function*.—**Scalar operation**, an operation which, performed upon a scalar, gives a scalar.—**Scalar quantity**. See *quantity*.

Shaped like a ladder; resembling a ladder. Specifically—(a) *In anatom.*, noting the venules or small cross-veins of an insect's wings when they are perpendicular to the longitudinal veins and placed at regular distances, like the rounds of a ladder. (b) *In bot.*, noting cells or vessels in which the walls are thickened in such a way as to form transverse ridges. These ridges, or alternating thick and thin places, follow each other with as much regularity as the rounds of a ladder.

2. *In conch.*, resembling or related to *Scalaria*; scalarian.—**Scalariform conjugation**, in fresh-water algae, conjugation between several cells of two different filaments, when the two lie very near one another side by side. Each cell of each filament sends out a short protuberance on the side facing the other filament. When these protuberances meet, the cell-wall becomes absorbed at the extremity of each, and an open tube is thus formed. It is the ordinary mode of conjugation in the *Monocarpiceae*.—**Scalariform vessels**, vessels in which the walls are thickened in a scalariform manner. They are especially abundant in ferns.

Scalariidae (skā-lār-i-dē), *n. pl.* [*NL.*, *< Scalaria* + *-idae*.] A family of ptenoglossate gastropods whose type genus is *Scalaria*; the wentletraps. The animal has elongated tentacles, with eyes near their external base, a single gill, and many uniform or aciculate teeth in each cross-row on the radula; the shell is turreted, with the aperture entire and subcircular. The species are numerous, especially in warm seas.—*Scalariidae, Scalariceae, Scalaris*. See *ent* under *Scalaria*.

2. A worthless, good-for-nothing, or contemptible fellow; a scamp; a scapegrace. The word was used in the southern United States, during the period of reconstruction (1865 to 1870 and later), in an almost specific sense, being oppressively applied by the opponents of the Republican party to native Southerners who acted with that party, as distinguished from *carpet-bagger*, a Republican of Northern origin. Cf. *scale¹*, *v.*] 1. A husk, shell, pod, or other thin covering of a seed or fruit, as of the bean.—2. In bot., a small rudimentary or thin scarios body, usually a metamorphosed leaf, scale-like in form and often in arrangement, constituting the covering of the leaf-buds of deciduous trees in cold climates, the involucre of the *Compositae*, the bracts of the catkin, the imbricated and thickened leaves which constitute the bulb, and the like. Also applied in the *Coniferae* to the leaves or bracts of the cone, and to the chaff on the stems of ferns. See also cuts under *imbricate* and *rusty-plant*.—3. In zool.,

a, the scale-like leaves of the stem of *Lathraea squamaria*; b, the cone with the scales of *Cupressus sempervirens*; c, the imbricate scale-like bracts of the spike of *Cyperus badius*.

an epidermal or exoskeletal structure that is thin, flat, hard or dry, and of some definite extent; a piece of cuticle that is squamous, scaly, or horny, and does not constitute a hair, a feather, or a horn, hoof, nail, or claw; a squamat; a scute; a scutellum. All these structures, however, belong to one class, and there is no absolute distinction. Scales are often of large size and great comparative thickness or solidity, and may be reinforced by bone, in which case they are commonly called *shells* or *plates*. Specifically—(a) In *ichth.*, one of the particular modifications of epidermis which collectively form the usual covering, more or less complete, of fishes; a fish-scale. They are of many forms and sizes, but have been sometimes considered under the four heads of *cycloid*, *ctenoid*, *ganoid*, and *placoid*, and fishes have been classified accordingly, as by Agassiz. (See *cycloid*, etc.) They are developed on the inner side of the general epidermis, but vary greatly in form and other characteristics. In most living fishes they are expanded horny lamellae, and imbricated, the posterior edges of one transverse row overlapping adjacent parts of the succeeding row. Growth takes place from a central, subcentral, or posterior nucleus by increase at the periphery. Generally the anterior part, or base of insertion, is provided with striae or grooves diverging backward. (1) In numerous fishes growth takes place in layers and at the posterior edges as much as at the anterior, and there are no teeth or denticles at the posterior margin; such are called *cycloid* scales. (2) When the posterior margin is beset with denticles, a *ctenoid* scale is the result. When vestiges of such teeth or denticles are retained on the surface between the nucleus and the posterior margin, the surface is to that extent *muciculated*. In other forms the growth is almost entirely sideways and forward, and the nucleus is consequently near the posterior edge. (3) Still other fishes have a hard enameled surface to the scale, which is generally of a rhomboidal form, and such a scale is called *ganoid*; but few modern fishes are thus armed, though scales of this kind were developed by numerous extinct forms. (4) When the scales are very small, or represented by ossified papillae of the cutis, they are called *placoid*; such are found in most of the sharks. Between these various types there are gradations, and there are also numerous modifications in other directions. The presence or absence of scales becomes also of slight systematic importance in some groups, and the same family may contain species with a scaleless body and others with scales of the ctenoid and cycloid types. The scales of various fishes, as the sheephead, mullet, and drum,

are used in the manufacture of ornamental work, as mock jewelry, flower-sprays, etc. Pearl-white or essence d'orient, used in making artificial pearls, is prepared from the scales of *Alburnus lucidus* and other cyprinoid fishes. (b) In herpetol., one of the cuticular structures which form the usual covering of reptiles proper, as distinguished from amphibians, as a snake or lizard. These scales are commonly small, and are distinguished from the special *shield* or *plates* which cover the head, and the large specialized *gastronotegs* or *urostegs* of the under parts, as of a serpent. They are usually arranged in definite rows or series, and are also called *scales* or *scutella*. In the *Chelonia* or turtles one of the thin plates of tortoise-shell which cover the carapace is a scale. See *tortoise-shell*. (c) In ornith., (1) A reduced feather, lacking hooked barbs, and with flattened stem; as the scales of a penguin. (2) A feather with metallic luster or iridescence, as those on the throat of a humming-bird. (3) A nasal opercle; a naricorne: as, the nasal scale. (4) One of the large regular divisions of the tarsal envelop; a scutellum: the smaller or irregular pieces being usually called *plates*. (d) In mammal., one of the cuticular plates which may replace hairs on much of the body; as, the scales of a pangolin.

4. Something like or likened to a scale: something desquamated or exfoliated; a flake; a shell; a scab.

Specifically—(a) A thin plate of bone; a scale-like or shell-like bone; as, the human lacrymal bone is a mere scale; the squamosal is a thin scale of bone. (b) A part of the periotraum, or epidermal covering of the shell of a mollusk. (c) One of the broad flat structures, or hemelytra, which cover some annelids, as the scalebacks, with a kind of defensive armor. (d) In entom., (1) One of the minute structures which constitute the covering of the wings of lepidopterous insects, as the furriness of a butterfly or moth. These are modified hairs which when well developed are thin, flat plates, pointed at the end where they are attached to the surface and generally divided into a number of long teeth at the other end; they are set in rows overlapping each other slightly, like tiles or shingles on a roof. These scales are ornamented with microscopic lines, and are of various and often very bright colors. By covering the transparent membrane of the wings they form the beautiful patterns much admired in these insects. See cut in next column, and cut under *Lepidoptera*. (2) One of the plates, somewhat similar to those on a butterfly's wing, covering the bodies of most *Thysanura* (*Lepisma saccharinum*, *Podura*). (3) One of the little flakes which, scattered singly or close together, so as to cover the whole surface in a uniform manner, ornament the bodies and

wing-covers of many beetles, especially species of *Curculionidae*. These scales are frequently mingled with hairs; they are often metallic and very beautifully colored. (4) One of the rudimentary wings of some insects, as fleas, or some similar process or formation on the thorax; as, the covering scale, the operculum or tegula of various insects. See *tegula*. (5) The shield covering the body of most female scale-insects (*Coccidae*), and subsequently, when the insect dies and shrivels up, serving to protect the

2. A series of marks laid down at determinate distances along a line, for purposes of measurement and computation; also, the rule upon which one or more such series are laid down.—3. In music: (a) A definite and standard series of tones within some large limiting interval, like an octave, selected for artistic purposes. The first step toward an artistic system of tones is the adoption of some interval for the division of the infinite possible range of tones into convenient sections of equal length. In Greek music, this unit of division was originally the tetrachord; in medieval music, the hexachord; and in modern music, the octave, though the octave is more or less recognized in all systems. Within the tetrachord, hexachord, or octave various scales are possible. (See *tetrachord* and *hexachord*.) The abstract method whereby the octave is divided and the succession of tones ordered within it is properly called a *mode*; but when a mode is applied at some given pitch the concrete result is called a *key* or *scale* (though *mode* and *scale* are often used interchangeably in the abstract sense). A scale is distinguished from a key in that it is used simply of the tones of the key when arranged in order of pitch. The successive tones of a scale are called *degrees*; they are usually numbered from below upward. The first tone or starting-tone is called the *key-note* or *key-tone*. The historic process of scale invention is, of course, unconscious. The selection of tones seems to be controlled primarily by an instinctive perception of their harmonic relations to the starting-tone and to each other, though limited and modified by a desire to secure an even melodic succession without too short intervals. When the smallest interval allowed is the whole step or major second, five-toned or pentatonic scales are produced, such as are used among the Chinese, in the older music of various Celtic nations, and by certain semi-civilized peoples. When the half step or semitone is tolerated, seven-toned or heptatonic scales are produced, as in the later Greek and all modern systems. When smaller intervals than the semitone are admitted, scales of more than seven tones are produced, as among the Hindus, the Persians, and other Orientals. In modern European music two chief forms of scale are used, the *major* and the *minor*, the latter having three varieties. (See *mode*), 7 (a) (2). Both forms are termed *diatonic*. When for purposes of modulation or of melodic variety, other intermediate tones are added, they are called *chromatic tones*, and a scale in which all the longer steps of a diatonic scale are divided by such intermediate tones is a *chromatic scale*, containing eleven tones in all. (See *chromatic*.) Properly an upward chromatic scale for melodic purposes differs from a downward, but on the keyboard they are assumed to be equivalent. In written music, a scale noted in both sharps and flats, so as to include the nominal constituents of both an upward and a downward chromatic scale, is called an *enharmonic scale*. A chromatic scale for harmonic purposes includes, in addition to the tones of the usual diatonic major scale, a minor second, a minor third, an augmented fourth, a minor sixth, and a minor seventh. When a scale of either kind is made up of tones having exact harmonic relations with the key-note, it is called *exact* or *pure*; but the compromise construction of the keyboard reduces all scales to an arbitrary form, called *tempered*. In solmization, the tones of a scale are represented by the syllables *do, re, mi, etc.* (See *interval*, *keyboard*, *solmization*, and *temperament*.) (b) Any particular scale based upon a given key-note: as, the *scale* of G or of F. Unless otherwise qualified, such a scale is understood to be a major scale. All major scales are essentially similar, except in pitch; all minor scales also, on the keyboard, however, there is considerable mechanical difference on account of the varying succession of the white and black digitals. (See *key*), 7 (c) Of a voice or an instrument, same as *compass*, 5. (d) In an organ-pipe, the ratio between its width and its length: a broad scale producing full, sonorous tones, as in the open diapason; and a narrow scale, thin, string-like tones, as in the dulciana. The same usage occurs occasionally in connection with other instruments: e. g., organs.

known. Many of them are leaf-feeders, others live on
fruit, flowers, honey, sap, decaying animal matter, and
excrement. The larvae are robust white grubs, living ordi-
narily underground, or in decaying stumps and logs, or
in dung. The males are usually much larger than the
females, and are often distinguished by horns upon the
head or prothorax, or by better-developed antennæ, or by
modifications of the legs. Many noted pests to agricul-
ture belong to this group, such as the May-beetles or
June-bugs and cockchafers of America and Europe, the
Anisoplia austriaca of the Russian wheat-fields, and the
rose-chaffer and fig-eater of the United States. Corre-

females lay their eggs.
The sacred scarab of
the Egyptians is *S. sac-

also that another spe-
cies, *S. latitollis*, was
held in religious veneration by the Egyptians, as the
scarab is sometimes figured by them with striate elytra,
a character which pertains to this alone. Species of *Ateu-
chus*, as *A. plus*, were formerly included in this genus.

Judd to designate a change in crystals, consisting in the development along certain planes of tabular, bacillar, or stellar inclusions, which, reflecting the light falling upon them, give rise to a submetallic sheen as the crystal is turned in various directions. This peculiarity has long been known to the Germans, and several minerals which exhibit it were classed together under the name of *schiller-spar* (which see). It is varieties of the monoclinic and rhombic pyroxenes, and especially bronzoite and diallage, that exhibit this schillerization.

Some of these crystals show traces of *schillerization* in one direction, which I take to be a face of the prism.

Quart. Jour. Geol. Soc., XLIV. 746.

Chemical reactions (like those involved in the process of *schillerization*) can readily take place.

Quart. Jour. Geol. Soc., XLV. 181.

schizomycete (skiz'ō-mi-sēt), *n.* A member of the *Schizomycetes*.

Schizomycetes (skiz'ō-mi-sē'tēz), *n. pl.* [NL., < Gr. *σχίζω*, cleave, split, + *μύκης*, *pl. μύκητες*, a fungus, mushroom: see *Myces*.] A class or group of minute vegetable organisms known as bacteria, microbes, microphytes, etc., and allied forms, belonging to the achlorophyllous division of the *Schizosporæ* of Cohn (the *Schizophyta* of later authorities), or to the *Protophyta* of still more recent authors. They were at first regarded as being simple fungi, and hence are sometimes still called *fission fungi*, but recent investigations indicate that they are more closely allied to the *Schizomycetes* or lower algae than to the true fungi. They are probably degenerate algae, a condition which has been brought about by their saprophytic or parasitic habits. They consist of single cells which may be spherical, oblong, or cylindrical in shape, or of filamentous or various other aggregations of such cells. The cells are commonly about 0.001 millimeter in diameter, or from two to five times that measurement; but smaller and a few larger ones are known. They are, with one or two exceptions, destitute of chlorophyll, and multiply by repeated bipartitions. True spores are known in several forms, but no traces of sexual organs exist. They are saprophytic or parasitic, and occur the world over as saprophytes. They abound in running streams and rivers, in still ponds and ditches; in the sea, in bogs, drains, and refuse-heaps; in the soil, and wherever organic infusions are allowed to stand; in liquids containing organic matter, as blood, milk, wine, etc.; and on solid food-stuff, such as meat, vegetables, preserves, etc. As parasites, numerous species inhabit various organs of men and animals, causing most of the infectious diseases, as tuberculosis, typhoid fever, cholera, etc. Plants are subject to their attack to a more limited degree, a circumstance that is probably due to the acid fluids of the higher vegetable organisms. Schizomycetes vary to a considerable extent according to the conditions of their environment, and hence many growth-forms occur which have frequently received different generic names. The round growth-forms are called *Coccus* or *Micrococcus*; the rod-like forms have been termed *Bacillus*, *Bacterium*, etc.; the shortly coiled forms are known as *Vibrio*; the spiral forms have received the names *Spirillum* or *Spirorcheta*; and the very elongated filiform ones are *Leptothrix*, etc. Their behavior with reference to the supply or exclusion of oxygen has led to their division by Pasteur into *aerobiotic*, or such as require a plentiful supply of free oxygen for the purpose of vegetation, and *anaerobiotic*, or those in which vegetation is promoted by the exclusion of oxygen, or at least is possible when oxygen is excluded. There are, however, various intermediate forms. See *eutophyte*, *Fungi*, *Protophyta*, *Bacteriaceæ*, *Bacterium*, *Micrococcus*, *Leptothrix*, *Bacillus*, *Spirillum*, *Spirorcheta*, *Vibrio*.

schizorhinal (ski-zō-rī-nal), *a.* [< Gr. *σχίζω*, cleave, split, + *ῥίς*, the nose, + *-al*.]

In *ornith.*, having each nasal bone deeply cleft or forked: opposed to *holorhinal*. The term denotes the condition of the nasal bone on each side (right and left), and not the separateness of the two nasal bones, which it has been misunderstood to mean. By a further mistake, it has been made to mean a slit like character of the external nostrils, with which it has nothing to do.

In the Columbidae, and in a great many wading and swimming birds, whose palates are cleft (schizoglossous), the nasal bones are *schizorhinal*, that is, cleft to or beyond the ends of the premaxillaries, such fissure leaving the external descending process very distinct from the other, almost like a separate bone. In geese, gulls, plovers, cranes, and other birds are thus split-nosed. Coates, *Key to N. A. Birds*, p. 165.

It is characterized by spikelets in scattered clusters forming a spike or panicle with numerous empty lower glumes and bisexual flowers with two or three lodicules, six stamens, three elongated styles, and a pedicel continued beyond the flowers. There are about 8 species, natives of the Malay archipelago, China, and the Pacific islands. They are tall and arborescent grasses, resembling the bamboo in habit and leaf. Several species reach 25 to 30 feet or more in height, and several are cultivated for ornament or for culinary use, the young shoots being eaten in Java and elsewhere under the name of *rebung*.

The blades are about 2 feet long, and the ends hinge out spirally, so that the blades are a few inches from the ends of the blades, and the sweeping blow around the adversary's head, the head of face with the shape of a wheel. The blade has a heavy basket-hilt completely protecting the hand. A heavy gauntlet of leather covers the forearm and wrist. The usual guard is by holding the blade with the right hand, the uppermost, the hand just above the level of the eyes.

Schlegelia (shleg'e-lī-ā), *n.* [NL. (Barnstedt, 1864), so called after Hermann Schlegel, an ornithologist of Leyden (1805-84).] A genus of birds of paradise. The species is *S. vitiensis*, better known as *Paradisea vitiensis* of Waggen and Batavia. The male is 7 inches long, the tail 2, with its middle pair of feathers as long as the two crossed and then curled in arched figure. The bald head

is bright blue; the fore back is rich yellow; the rest lustrous crimson; the breastplate is mostly glittering green, and other parts of the plumage are of varied and scantly less burnished hues. The female is somewhat smaller, and in plumage unlike the male, as usual in this family. The species has several technical synonyms. Professor Schlegel called it *Paradisea vitiensis*, but not till after Mr. Cassin of Philadelphia had dedicated it to Dr. F. B. Wilson of that city. Mr. Elliot the monographer of the *Paradisidae*, has it *Dipholites vitiensis*, after a mistaken identification made by Dr. Schlegel of a bird very inadequately characterized by Prince Bismarck, which belongs to another genus.

Schleichera (shlī'kē-rā), *n.* [NL. (Willdenow, 1805), named after J. C. Schleich, a Swiss botanist, author (1800) of a Swiss flora.] A genus of plants of the order *Sapindales*, type of the tribe *Schleicherieae*. It is characterized by apetalous flowers with a small calyx of four to six uniform and valvate lobes, a complete and repand disk, six to eight long stamens, and an ovary with three or four cells and solitary ovules, becoming a dry and indurated one to three-eighth-ovoid and multilocular fruit, containing a pulpy and edible aril about the black top-shaped seed. The only species, *S. tripartita*, is a native of India, Ceylon, and Burma, especially abundant in Pegu, sometimes called *lac tree*, and known in India as *kosambi*. It is a large hard-wood tree with alternate and abruptly pinnate leaves, usually of three pairs of leaflets, and with small long-petioled flowers in slender racemes. Its timber is very strong, solid and durable. In India and Ceylon it is valued as one of the trees frequented by the lac insect (*see lac*), and its young branches form an important source of shellac. The oil pressed from its seeds is there used for burning in lamps and as a remedy for the itch.

Schleichereae (shlī'kē-rē-ē), *n.* pl. [NL. (Radlkoter, 1888), < *Schleichera* + *-eae*.] A tribe of dicotyledonous plants of the order *Sapindales* and suborder *Sapinales*, typified by the monotypic genus *Schleichera*, and containing also 3 other species in 2 genera, natives of tropical Africa and Madeira.

(b) Mosaic glass or flint glass of any sort.

scholasticism (sko-las'ti-sizm), *n.* [= *Sp. escolasticismo* = *G. scholasticismus*, *< NL. scholasticismus*, *scholasticism*, *< L. scholasticus*, *scholastic*; see *scholastic*.] The Aristotelian teaching of the medieval schools and universities, and similar teaching in Roman Catholic institutions in modern times, characterized by acknowledgment of the authority of the church, by being largely, if not wholly, based upon the authority of the church fathers, of Aristotle, and of Arabian commentators, and by its stiff and formal method of discussion. It consisted of two distinct

and independent developments, the one previous the other subsequent to the discovery of the extraliterary works of Aristotle in the last part of the twelfth century. Scholasticism should be considered as arising about A. D. 1000, and is separated by the cessation of the Roman schools and the lowest ebb of thought (such as Isidorus, Rhabanus, Gerbert, writers directly or indirectly under Arabian influence, Scotus Erigena and other Irish monks, the English Alcuin, with his pupil Frigidarius, etc.), writers marked by great ignorance, by a strong tendency to materialize abstractions, by a disposition to adopt opinions quite arbitrarily, but also by a certain freedom of thought. The first era of scholasticism was occupied by disputes concerning nominalism and realism. It naturally falls into two periods, since the disputants of the eleventh century took simple and extreme ground on one side or the other, the nominalistic rationalist Berengarius being opposed by the realistic prelate Lanfranc, the Platonizing nominalist Roscelin by the mystical realist Anselm; while in the twelfth century the opinions were sophisticated by distinctions until they ceased to be readily classified as nominalistic and realistic. The scholastics of the latter period included Peter Abelard (1079-1142); Gilbert of Poitiers (died 1154), one of the few writers of the twelfth century ever quoted in the thirteenth; Peter Lombard (died 1164), compiler of the four books of "Sentences," or opinions of the fathers, which was the peg on which much later speculation was hung as commentary; and John of Salisbury (died 1180), an elegant and readable author. For more than a generation after his death the schoolmen were occupied with studying the works of Aristotle and the Arabians, without producing anything of their own. Then began the second era of scholasticism, and this divides itself into three periods. During the first, which extended to the last quarter of the thirteenth century, Alexander of Hales (died 1245), Albertus Magnus (1193-1280), and St. Thomas Aquinas (died 1274) set up the general framework of the scholastic philosophy, while Petrus Hispanus (perhaps identical with Pope John XXI., who died 1277) wrote the standard text-book of logic for the remainder of the middle ages, and Vincent of Beauvais (died about 1264) made an encyclopedia which is still found in every library of pretension. During this period the University of Paris received a thorough organization, and thought there became exclusively concentrated upon theology. The second period, which lasted for about a century, was the great age of scholastic thought, and it may be doubted whether the universities of western Europe have at any subsequent time been so worthy of respect as when Pans Scotus (died 1308) and his followers were working up the realistic conception of existence, while "Durant" Durandus (died 1332), Occam (died about 1349), and Buridanus (died after 1350) were urging their several nominalistic theories, and other writers, now so forgotten that it is useless to name them, were presenting other subtle propositions commanding serious examination. During this period the scholastic forms of discussion were fully elaborated—methods cumbersome and inelegant, but enforcing exactitude, and conformed to that stage of intellectual development. The third period, extending to the time of the extinction of scholasticism, early in the sixteenth century, presented somewhat different characters in different countries. It was, however, everywhere marked by the formal perfectionment of systems, and attention to trivial matters, with decided loss of vitality of thought. Among the innumerable writers of this time may be mentioned Albert of Saxony (fourteenth century), Pierre d'Ailly (1350-1425), Gerson (1363-1429), and Eckius, adversary of Luther. Those subsequent writers who follow colorless traditions of scholasticism, and maintain front against modern thought, must be considered as belonging to an era different from either of those mentioned.

scholia, *n.* Latin plural of *scholium*.
scholiast (skō'li-as'tik), *n.* [*< scholiast = Sp. escoliasta = Pg. escoliaste = It. scoliaste = G. scholiast, < NL. scholiasta, < MGr. σχολιαστής, a commentator, < σχολιάζω, write commentaries, < Gr. σχολίζω, a commentary; see scholium.*] One who makes scholia; a commentator; an annotator; especially, an ancient grammarian who annotated the classics.

The title of this satire, in some ancient manuscripts, was "The Reproach of Idleness"; though in others of the *scholastic* it is inscribed "Against the Luxury and Vices of the Rich." *Dryden*, tr. of Persius's Satires, iii., Arg.

mark; an explanatory comment; specifically, an explanatory remark annexed to a Latin or Greek author by an early grammarian. Explanatory notes inserted by editors in the text of Euclid's "Elements" were called *scholia*, and the style of exposition resulting from this was considered by later writers so admirable that they deliberately left occasion for and inserted scholia in their own writings. A geometrical scholium is, therefore, now an explanation or reflection inserted into a work on geometry in such a way as to interrupt the current of mathematical thought.

Schomburgkia (shom-bur'ki-ä), *n.* [*NL. Lindley*, 1838), named after the traveler R. H. Schomburgk (1804-65).] A genus of orchids, of the tribe *Epidendrea* and subtribe *Laticæ*. It is characterized by a terminal and loosely racemed inflorescence with a somewhat wavy perianth, each anther with eight pollen-masses, four in each cell. There are about 13 species, all natives of tropical America. They are epiphytes with handsome flowers in a simple raceme on an elongated terminal peduncle, and thick pseudobulbs or long fleshy stems, which are covered with many sheaths and bear at the apex one, two, or three ovate or elongated rigid and fleshy leaves. They are remarkable for the very long and slender flower-stems, and the large dry sheaths enveloping them. In *S. thibensis* of Honduras, the hollow pseudobulb, from 1 to 2 feet long, is a favorite with ants for the construction of their nests, and is used by children as a trumpet (whence also its name in cultivation of *corn-horn orchid*).

The name is also sometimes, though more rarely, given to an earlier school in the same university, which taught almost exactly the reverse—namely, the credibility, integrity, and authority of the New Testament.

Sciadium (si-a-di'um), *n.* [*NL.* (A. Brann), *<* *Gr.* *σκιάδιον*, *an umbrella* or *sunshade*, *<* *σκιά*, *shade, shadow*.] A genus of fresh-water algae, of the order *Ermolidae* and class *Proto-coccoidae*, typical of the family *Sciadiaceae*. Each cell-family is composed of a number of cylindrical cells, each of which is contracted at the base into a short slender stem by which they are united, causing the long cells to spread above.

Sciadophyllum (si-a-dō-fil'um), *n.* [*NL.* (P. Browne, 1756), so called with ref. to the use of the leaves as a sunshade; *<* *Gr.* *σκιά* (*σκιάδ-*), a shade, canopy (*<* *σκιά*, *shade*), + *φυλλον*, leaf.] A genus of polypetalous plants, of the order *Arabidaceae* and series *Panicaceae*. It is characterized by flowers with usually five valvate petals united at the apex into a deciduous membrane, as many rather long stamens, a flattened disk, and an ovary with three to five cells with distinct styles. The fruit consists of fleshy drupes with a hard compressed stone. There are about 25 species, all natives of tropical America. They are trees or shrubs, usually with radiately compound leaves and entire leaflets, and often with elongated stipules. Their flowers are borne in small heads or in umbels which are grouped in a raceme or panicle or terminal umbel. For *S. Brownei*, also called *angelica tree*, see *angelica tree*; for *S. capitatum* (*Hedera multiflora*), also known as *candlewood*, see *broad-leaved balsam*, under *balsam*. A third West Indian species, *S. Jacquinii* (also *Aralia arborea*), a small tree bearing elliptical leaves and white berries, is there known as *lobolly sweetwood*.

Sciadopitys (si-a-dop'i-tis), *n.* [*NL.*, *<* *Gr.* *σκιάδιον* (*-ad-*), a shade, canopy, + *πίτεξ*, a pine-tree; see *pine*.] A genus of coniferous trees, of the tribe *Abietinae* and subtribe *Taxodinae*, distinguished by a lamina which bears seven to nine ovules and becomes greatly enlarged and hardened, composing nearly the whole scale of the cone when mature. The only species, *S.* (sometimes *Taxus verticillata*), is a native of Japan, known in cultivation as *umbrella-pine* and *parasol-pine*. It is a tall evergreen tree, bearing as its true leaves minute scales, and as apparent leaves, rigid linear phyllodia, resembling pine-needles, which are produced yearly in small radiating and long-persistent tufts. The hard, thick cones, about 3 inches long, consist of numerous closely imbricated rounded woody scales which finally gape apart as in the pine, discharging the flattened and broadly winged seeds. It is a tree of slow growth, with compact white wood, and reaches a height of 80 or sometimes 130 feet.

Sciæna (si-ē-nā), *n.* [*NL.* (Artedi), *<* *L.* *sciæna*, *<* *Gr.* *σκίανα*, a sea-fish, the maigre, *<* *σκιά*, *shade, shadow*.] A Linnean genus of fishes, typical of the family *Sciænidae*. It is restricted by recent authors to such *Sciænidae* as have the lower pharyngeal bones distinct, the lower jaw without barhels, the anal spines two, and well-developed teeth persistent in both jaws. In this narrow sense the species are still so numerous in all warm seas that attempts have been made to establish various sections regarded by some as of generic

value. The fish to which the classic name *sciæna* was given is the maigre, *S. aquila*. *S. (Sciænops) uclata* is the reddish, red horse, red-bass, or channel-bass, which occurs along the Atlantic coast of the United States, attains a weight of from 30 to 40 pounds, and is known by an ocellus on each side of the tail (see cut under *redfish*). *S. (Rhino-sciaenops) salmiana* is the red rounder of the same country. See also cut under *rounder*.

Sciænidae (si-en-i-ā-ē), *n. pl.* [*NL.*, *<* *Sciæna* + *-idae*.] A family of acanthopterygian fishes, typified by the genus *Sciæna*, to which different limits have been ascribed. (a) By Bonaparte, in 1823, the name was applied to the *Sciænoides*, which form Cuvier's third family of acanthopterygian fishes. These have the preoperculum serrated and spines to the operculum, the bones of the cranium and face generally cavernous, and no teeth on the vomer and palatines. It included not only the true *Sciænidae*, but many other fishes erroneously supposed to be related. (b) By Muller it was restricted to those species of *Sciænoides* which have separate lower pharyngeals. (c) By Lowe it was limited to fishes with an oblong or moderately elongated body, covered with ctenoid scales, with the lateral line continuous and running out on the caudal fin, the head with the bones more or less cavernous and with the snout projecting, dorsal fins two (the first short and with spines and the second elongate or oblong), the anal short or moderate with not more than two spines, the pectorals with branched rays,

and the ventrals thoracic and complete. In this sense it has been used by almost all recent writers. (d) In Günther's system it is the only family of the *Acanthopterygii sciæniformes*. It is a large and important family of 150 species of about 30 genera; many reach a large size, and nearly all are valued food-fishes. They are carnivorous, and most of them make a noise variously called *croaking*, *grunting*, *snoring*, and *drumming*. The air bladder is generally complicated, and supposed to be concerned in the production of the noise. Hence various names of these fishes, as *croakers*, *grunters*, *snorers*, *drummers*, *rounders*, etc. With few exceptions, the members of this family are salt-water fishes, and they are widely distributed in tropical, warm, and temperate seas. Two species are British, the maigre, *Sciæna (Pseudosciaenops) aquila*, and the heeled umbria, *Umbria cirrosa*. Many are American, as the fresh-water drum, croaker, sheepshead, or thunder-pumper, *Hoplosternus genivittatus*; the drum, *Pogonias cromis*; redfish and rounders of the genera *Sciæna*, *Sciaenops*, and *Rounders*; the spot or layfate, *Leiostomus xanthurus*; a kind of croaker, *Micropterus undulatus*; rounders of the genus *Umbria*; kingfish of the genus *Merluccius*; queenfish of the genus *Seriola*; weakfish, sea-trout, or squeteagons of the genus *Cynoscion* (formerly *Otolithus*). The family is divisible into the subfamilies *Sciæninae*, *Otolithinae*, *Leiostominae*, and *Hoplosterninae*. Also *Sciænoides*. See cuts under *croaker*, *drum*, *redfish*, *rounder*, *Sciæna*, and *weakfish*.

2. Knowledge gained by systematic observation, experiment, and reasoning; knowledge coördinated, arranged, and systematized; also, the prosecution of truth as thus known, both in the abstract and as a historical development.

Since all phenomena which have been sufficiently examined are found to take place with regularity, each having certain fixed conditions, positive and negative, on the occurrence of which it invariably happens, mankind have been able to ascertain . . . the conditions of the occurrence of many phenomena; and the progress of science mainly consists in ascertaining these conditions.

Ruskin, *The Eagle's Nest* (1872), § 3.

plants, type of the tribe *Scilleae*. It is characterized by flowers with separate spreading perianth-segments, marked by a single central nerve, stamens with thread-shaped filaments, and a three-celled ovary with slender style, and usually two ovules in each cell. The fruit is a thin globose three-lobed capsule, long enveloped by the withered perianth, and containing three to six black obovoid or rounded seeds with a hard albumen. There are about 80 species, natives of the Old World throughout temperate regions, and also within the tropics upon mountains, with one species said to occur in Chili. They are stemless plants from an onion-like coated bulb, with narrow leaf-like leaves, and flowers on a leafless scape, which are blue, pink, or purple, and form racemes which are often very much prolonged. Many are cultivated for borders, especially *S. amurensis* (S. *Sibirica*), with porcelain-blue flowers in earliest spring. (For various species formerly classed here, see *scilla*, *Urginea*, *Camassia*, and *camass*.) Several species are known as *wild hyacinth*. (See *hyacinth*, 2.) *S. verna*, the spring squill of England, is also known as *sea-onion*. *S. nutans*, a beautiful species abundant in British coasts, by some assigned to a genus *Endymium* (Dumortier, 1827), is known in England as *bluebell*, in Scotland as *harebell*, exchanging names with *Campanula rotundifolia*, which is the bluebell of Scotland, but the harebell of England and the United States. *S. nutans* is also known as *bell-bottle*, *crow-bells*, *crow-leek*. See also *clavertree*, 2, and *cut under scape*.

They do not produce umbels as the related tribe *Allieae*, nor flowers so few nor so large as the *Tulipeae*; otherwise, in habit and in growth from a coated bulb, the three tribes are closely akin. The *Scilleæ* include about 23 genera, of which *Scilla* is the type, mainly natives of temperate climates and very largely South African. For important genera, see *Hyacinthus*, *Muscari*, *Ornithogalum*, *Camassia*.

It is characterized by a shrubby climbing stem, branches bearing numerous usually oblique leaves with numerous nearly equal curving veins, and bisexual flowers without floral envelopes, consisting of four stamens and a thick truncate and somewhat prismatic ovary which is strongly dilated upward and contains one cell and one ovule with a large embryo destitute of albumen. There are 8 species, natives of the East Indies, especially Bengal and Java. They are climbing shrubs clinging by rootlets produced on the branches, and bear taper-pointed leaves, ovate or narrower, with long broadly sheathing petioles. The flowers are borne in dense masses over a cylindrical spadix enclosed in a boat-shaped spathe, and form in fruit a syncarp of closely united juicy berries. Many remarkable plants of other genera have been cultivated under this name, especially those with perforated leaves now classed under *Monstera*. Some species have been called *Indian ivy*, as *S. hederaea*, a vine with abruptly pointed leaves. Several bear ornamental white-mottled leaves, as *S. (Pothos) argyrea*, cultivated from the Philippines under the name *silver-vine*. Several others have often been cultivated under the name *Pothos*. The fruit of *S. officinalis* is prescribed in India as a diaphoretic, dried sections of it being sold by the native druggists under the name *gaj-pippad*.

3. Specifically, the twinkling or tremulous motion of the light of the larger fixed stars. By shaking the head, so as to elongate the image, it is seen that not merely the intensity, but also the color of the light varies. See *scintillometer*.

scintillometer (sin-ti-lom'e-tēr), *n.* [*< L. scintilla*, a spark, + *Gr. μέτρον*, measure.] An instrument devised by Montigny for measuring the intensity of scintillation of the stars. The apparatus consists essentially of a circular glass plate mounted obliquely upon an axis very near and in front of the eyepiece of a telescope. An opening in the center of the plate allows the insertion of a ring, through which passes the axis, parallel to the optical axis of the telescope

and at a distance from it of about twenty-five millimeters. The plate is rotated about the axis by a mechanism. By this device, the rays of light from a star are refracted through the inclined glass plate, and the image describes a perfect circle in the field. If the star undergoes no change, the circumference is a continuous line exhibiting the color of the star; but if the star scintillates, this circumference is divided into fugitive arcs of different colors. The number of changes of color per unit of time indicates the intensity of the scintillation.

It is the ingratful Genius of this Age that, if any *Sciolist* can find a Hole in an old Author's Coat, he will endeavour to make it much more wide. Howell, Letters, iv. 31.

It is of great importance that those whom I love should not think me a precipitate, silly, shallow *sciolist* in politics, and suppose that every frivolous word that falls from my pen is a dogma which I mean to advance as indisputable. Macaulay, in Trevelyan, I. 105.

sciolistic (si-ō-lis'tik), *a.* [*< sciolist* + *-ic*.] Of or pertaining to sciolism or sciolists; resembling a sciolist; having only superficial knowledge; shallow.

It includes about 1,500 species, of 17 genera, of which *Scirpus*, the bulrush, is the type. They are grass-like or rush-like plants, with either triangular or rounded stems, and with long flat triangular or cylindrical leaves. The inflorescence becomes chiefly conspicuous when in fruit, and is often ornamental from its shape or from its dark-brown colors, or by reason of the frequent lengthening of the bristles into woolly or plumelike tufts.

It is characterized by small many-flowered roundish spikelets with imbricated and numerous glumes, each flower bisexual and usually with six bristles, representing a perianth, and surrounding the ovary, from which the continuous and slender style falls away without leaving any conspicuous tubercle.

They are small tufted or floating annuals, or strong perennials with a creeping rootstock, bearing usually a compound panicle of numerous brown spikelets, sometimes reduced to a small cluster or solitary. They are known by the general names *bulrush* and *club-rush*, the first applied especially to *S. lacustris*, a species of peculiar habit, with tall, smooth, round stems of a blue-green color projecting out of lake- and river-waters; also called in England *mar-rush*, from its use in making mats, ropes, chair-bottoms, and hassocks. By many later, especially German, writers the term has been transferred to the hard bast or liber, a tissue of plants composed of cells whose walls are thickened, often to a very considerable extent. There are over 100 species, natives of tropical and subtropical regions, extending into temperate climates in North America, where 12 species (known as *nutgrass*) occur on the Atlantic coast, 3 as far north as Massachusetts. They are rush-like herbs of various habit, either low and spreading or tall and robust, bearing grass-like leaves, and often with rigid prickly-pointed bracts below the involucre, giving to *S. flaccida* the name *cutting-grass* in the West Indies. The epithet notes the corallum, which forms a solid axis that is invested by the soft parts of the animal. The sclerobasic corallum is in reality an exoskeleton, somewhat analogous to the shell of a crustacean, being a true tegumentary secretion. It is termed *fundamentum* by Dana. The sclerobasic corallum is produced by a compound organism only, and can be distinguished from a sclerodermic corallum by being usually more or less smooth, and invariably devoid of the cups or receptacles for the separate polyps always present in the latter. **Sclerobasic Zoantharia**. Scolopaceous Curlew (*Limosa scolopacea*).

are more or less lengthened, usually bare above the suffrago, scutellate or partly reticulate; there are four toes, with few exceptions, cleft to the base or furnished with one or two basal claws, never full-webbed nor lobate. The *Scolopacidae* average of small size, like plovers; they nest almost always on the ground, and lay four pointed pyriform eggs; the young are hatched downy, and run about at once. The family is of cosmopolitan distribution. See snipe, and cuts under *Limosa*, *ruff*, *Rhyacophilus*, *Rhyacchora*, *sanderling*, and *redshank*.

Scolopacinae (skol'ō-pā-sī'nē), *n. pl.* [NL., < *Scolopus* (-pac-) + *-inae*.] A subfamily of *Scolopacidae*, represented by the genus *Scolopus* and its immediate relatives; the true snipes and woodcocks. The bill is at least twice as long as the head, straight, with closely contracted gape, very long nasal grooves, and great sensitiveness. The leading genera besides *Scolopus* are *Philohela* (the American woodcock), *Gallinago* (the ordinary snipe), and *Macrorhinphus*. See these words.

scolopacine (skol'ō-pas-in), *a.* [*< Scolopus* (-pac-) + *-ine*.] Snipe-like; resembling, related to, or characteristic of snipes; belonging to the *Scolopacidae*, and especially to the *Scolopacinae*.

scolopacoid (skol'ō-pak-oid), *a.* [*< Gr. σκολοπαῖς* (-τακ-), a snipe, + *-oides*, form.] Resembling a snipe, plover, or other limicoline bird; limicoline; charadriomorphous; belonging to the *Scolopacidae*.

Scolopacoideae (skol'ō-pā-koi'dē-ē), *n. pl.* [NL., < *Scolopus* (-pac-) + *-oideae*.] A superfamily of wading birds, the snipes and their allies; the plover-snipe group; synonymous with *Limicolae* and *Charadriomorphae*. [Recent.]

Scolopax (skol'ō-paks), *n.* [NL., < *L. scolopus*, < *Gr. σκολοπαῖς*, a large snipe-like bird, perhaps a woodcock.] A Linnaean genus of *Scolopacidae*, formerly including most of the scolopacine and some other birds, but now restricted to the genus of which the European woodcock, *S. rusticola*, is the type; in this sense synonymous only with *Rusticola*. The birds most frequently called snipe belong to the genera *Gallinago* and *Macrorhinphus*. See snipe.

scolopanderi, *n.* Same as *scolopendra*.

scolopendra (skol'ō-pen'drā), *n.* [Also *scolopander*; < *P. scolopendra* = *Sp. Pg. scolopendra* = *It. scolopendra*, < *L. scolopendra*, a milleped, also a certain fish supposed, when caught by a hook, to eject its entrails, remove the hook, and then take them in again; < *Gr. σκολοπενδρα*, a milleped, also the sea-scolopendra, an animal of the genus *Nereis*, or *Aphrodite*, 2.] 1. Some imaginary sea-monster.

Bright *Scolopendras* armed with silver scales.

Spenser, F. Q., II. xii. 23.

2. [*cap.*] [NL. (Linnaeus, 1735).] A Linnaean genus of myriapods, approximately the same as the class *Myriapoda*, subsequently variously restricted, now the type of the limited family *Scolopendridae*, and containing such centipeds as have the cephalic segments imbricate, four stemmatous ocelli on each side, attenuated antennae, and twenty-one pairs of feet. Among them are the largest and most formidable centipeds, whose poisonous claws inflict very painful and even dangerous wounds. Such is *S. castaneiceps*, of a greenish color with chestnut head, and 5 or 6 inches long, justly dreaded in southerly portions of the United States. See cuts under *basilar*, *centiped*, *cephalic*, and *epithelium*.

Scolopendrella (skol'ō-pen-drel'ā), *n.* [NL., < *Scolopendra* + *-ella*.] The typical genus of *Scolopendrellidae*.

Scolopendrellidae (skol'ō-pen-drel'i-dē), *n. pl.* [NL., < *Scolopendrella* + *-idae*.] A family of centipeds, named from the genus *Scolopendrella*, having the body and limbs short, the antennae long with more than sixteen joints, and sixteen imbricated dorsal scutes. Also *Scolopendrellinae*, as a subfamily. *Newport*.

Scolopendridae (skol'ō-pen'dri-dē), *n. pl.* [NL., < *Scolopendra* + *-idae*.] A family of chilopod myriapods, typified by the genus *Scolopendra*, and variously restricted. In a now usual acceptance it includes those centipeds which have from twenty-one to twenty-three limb-bearing segments, uniserial scutes, few ocelli if any, and the last pair of legs thickened and generally spinose. There are many genera. The family is contrasted with *Ceratomyidae*, *Lithobiidae*, *Scolopendrellidae*, and *Geophilidae*.

Scolopendriæ (skol'ō-pen-dri'ē-ē), *n. pl.* [NL., < *Scolopendrium* + *-æ*.] A tribe of ferns, typified by the genus *Scolopendrium*. The sori are the same as in the *Asplenium*, except that they are arranged in pairs and open toward each other.

They are physoclistous fishes, with the body scaly and a series of keeled scales along each side of the belly, the margin of the upper jaw formed by the intermaxillaries mesially and by the maxillaries laterally, the lower pharyngeals united in a single bone, and the dorsal fin opposite the anal. In a broad sense, the family consists of about 8 genera and 100 species, including the belonids or gars, the hemirhamphines or halfbeaks, and the xiphocephalines or flying-fish. In a restricted sense, it includes the flying-fishes and hemirhamphines as well as the sauries, the belonids being excluded. Also *Scomberesocidae*. See cut under *saury*.

The body is long, compressed, and covered with small deciduous scales; the jaws are more or less produced into a beak; the gill-rakers are long, slender, and numerous; the air-bladder is large; and there are no pyloric caeca. The dorsal and anal fins are opposite as in *Esocæ*, and finlets are developed as in *Scomber*. In *S. saurus*, the true saury, also called *skipper* and *bill-fish*, the beak is long; the color is olive-brown, silvery on the sides and belly; and the length is about 18 inches. This species is wide-ranging in the open sea. *S. brevicestris* is a smaller saury, with the jaws scarcely forming a beak; it is found on the coast of California. Also *Scomberesox*. See cut under *saury*.

table. A technical difference from *Scomber* is the length of the spinous dorsal fin, which has more than twelve spines and is contiguous to the second dorsal, the presence of a caudal keel, the strength of the jaw-teeth, and the weakness of those on the vomerine and palatine bones. This genus used to be called *Cybinus*; its type is the cero, *S. regalis*, which attains a weight of 20 pounds. *S. caballa* sometimes weighs 100 pounds. genus *Scomber*, to which very different limits have been ascribed. (a) In Günther's system, a family of *Acanthopterygii catenuliformes*, with unpaired checks, two dorsal fins, either finlets or the spinous dorsal composed of free spines or modified into a sutorial disk, or the ventral jugular and composed of four rays, and scales none or very small. (b) By Bonaparte, first used as a synonym of *Scomberoides* of Cuvier; later restricted to such forms as had two dorsal fins or several of the first rays of the dorsal spiniform. (c) By Gill, limited to *Scomberoides* of a fusiform shape, with the first dorsal fin elongate, or separated by a wide interval from the soft dorsal, with posterior rays of the second dorsal and of the anal generally detached as special finlets, and with numerous vertebrae. The body is elongate, not much compressed, and covered with minute cycloid scales, or quite naked; the scales sometimes united into a kind of corset anteriorly; the lateral line is present; the branchiostegals are seven; the dorsal fins two, of which the first has rather weak spines, and the second resembles the anal; the caudal peduncle is very slender, usually keeled, and the lobes of the caudal fin are divergent and falcate, producing the characteristic deeply forked tail; the ventral fins are thoracic in position, of moderate size, with a spine and several soft rays; the vertebrae are numerous (more than twenty-five); pyloric caeca are many; the air-bladder is present or absent; the coloration is metallic and often brilliant. There are 17 genera and about 70 species, all of the high seas and wide-ranging, in some cases cosmopolitan; and among them are extremely valuable food-fishes, as mackerel of all kinds, bonitos, tunnies, and others. Scombrinae (skom-brī'nē), *n. pl.* [*N.L.*, *<* *Scomber* + *-inae*.] A subfamily of *Scombridae*, to which various limits have been assigned. (a) By Gill, limited to those *Scombridae* which have two dorsals widely distant, and thus including only the typical mackerels and frigate-mackerels. (b) By Jordan and Gilbert, extended to embrace those with finlets, and with the dorsal spines less than twenty in number. It thus includes the mackerels, frigate-mackerels, tunnies, bonitos, and Spanish mackerel.

They are numerous in tropical seas. By recent writers two subdivisions are ranked as genera. In the typical species the dorsal spines are seven in number, the pterygoids are armed with teeth, and the scales are normally developed. But in the American representative there are no pterygoid teeth, and the linear scales are embedded. 9. In *music*, a written or printed draft or copy of a composition on a set of two or more staves braced and barred together. In a full or orchestral score, a separate staff is assigned to each instrument and voice, so that it contains all that is indicated in all the instrumental or vocal parts taken together. A vocal or piano score is one in which the voice-parts are given in full, usually on separate staves, while the accompaniment is condensed into two staves for performance on a pianoforte or organ. An organ score is either the same as the last or one in which three staves are used, as in regular organ music. A score in which more than one part is written on a staff is called *short*, *close*, or *compressed*, especially in the case of four-part vocal music when written on two staves; but these terms are also occasionally applied to an abridged or skeleton transcription. In an orchestral score the various parts are usually grouped, so that instruments of the same class appear together. The usual arrangement is (read downward) wood wind (flutes, oboes, clarinets, bassoons), brass wind (horns, trumpets, trombones), percussion (tympani, cymbals), upper strings (violins, violas), voices (soprano, alto, tenor, bass), lower strings (violoncellos, double basses); but considerable variations from this order occur. The arts of reading from a full score, and of transcribing for the pianoforte from such a score, are among the most difficult branches of musical accomplishment. Also *partition*.

I use the phrase in *score*, as Dr. Johnson has explained it in his Dictionary: "A song in *score*, the words with the musical notes of a song annexed." But I understand that in scientific propriety it means all the parts of a musical composition noted down in the characters by which it is exhibited to the eye of the skillful.

His method is the logical analysis of the elements of existence. His fundamental doctrine is that distinctions which the mind inevitably draws are to be considered as real, although they do not exist in the things apart from their relations to mind. Such distinctions were called *formal*, the abstractions thence resulting *formalities*, and those who insisted upon them *formalists* or *formalizers* (Middle Latin *formalitates*). He taught the important principle of *heceity* — that individual existence is no quality, is capable of no description or general conception, but is a peculiar element of being. He held that the natures of genera and species, as *animal* and *horse*, are real, and are not in themselves either general or particular, though they cannot exist except as particular nor be thought except as general. The teaching of Scotism in the English universities was prohibited by the royal injunctions of 1535.

See the adjectives. — **Differential screw**, an arrangement consisting of a male screw working in a female screw and having a female screw cut through its axis with a different pitch, a second male screw working in this. It is so named from having been first employed by Mr. Hindley of York in England. — **Hunter's screw** [named from its inventor, Dr. John Hunter], a double screw consisting of a principal male screw that turns in a nut, but in the cylinder of which, concentric with its axis, is formed a female screw of different pitch that turns on a secondary but fixed male screw. The device furnishes a screw of slow but enormous lifting power without the necessity of finely cut and consequently frail threads. Everything else being equal, the lifting power of this screw increases exactly as the difference between the pitches of the principal male screw and the female screw diminishes, in accordance with the principle of virtual velocities. — **Interrupted screw**. See *interrupted*. — **Interrupted screw**, in *mach.*, a screw part or parts of whose thread are cut away, rendering it discontinuous; specifically, a screw whose exterior is divided into six

equal parts, with the screw-threads removed from alternate sectors, used to form the closure of a breech loading cannon. In some cases the interruptions extend entirely around the screw, so that, in the common parlance of mechanics, "every other thread" is removed. Such a screw will turn perfectly in a nut of sufficient length. See *cut under cannon*.—**Involution of six screws**. See *cuts under compound and lathe*.—**Screw propeller**, a propeller acting on the principle of the screw, attached to the exterior end of a shaft protruding through the hull of a vessel at the stern. It consists of a number of spiral metal blades either cast together in one piece or bolted to a hub. In some special cases, as in ferry-boats, there are two screws, one at each end of the vessel. In some war-vessels transverse shafts with small propellers have been used to assist in turning quickly. An arrangement of screws now common is the twin-screw system, in which two screws are arranged at the stern, each on one of two parallel shafts, which are driven by power independently of the other. By stopping or slowing up one shaft while the other maintains its

velocity, very rapid turning can be effected by twin screws, which have, moreover, the advantage that, one being disabled, the vessel can still make headway with the other. Some vessels designed to attain high speed have been constructed with three screws. A very great variety of forms have been proposed for screw-propeller blades; but the principle of the original true screw is still in use. Variations in pitch and modifications of the form of the blades have been adopted with success by individual constructors. The actual area of the screw propeller is measured on a plane perpendicular to the direction in which the ship moves. The outline of the screw projected on that plane is the actual area, but the effective area is, in good examples, from 0.2 to 0.4 greater than this; and it is the effective area and the mean velocity with which the water is thrown astern that determine the mass thrown backward. The mass thrown backward and the velocity with which it is so projected determine the propelling power. A kind of feathering propeller has also been used, but has not been generally adopted. Compare *conveyor*.—**Triple screw**, a screw having three consecutive threads, all of the same pitch.—**Under the screw**, subjected to or influenced by strong pressure; compelled; coerced.—**Variable screw**, in lathes and other machines, a feed-screw which by the varying velocity of its rotation gives a variable feed.—**V-threaded screw**, a screw having a thread of triangular cross-section. Scrophularia (skrof'ū-lā'ri-ū), *n.* [NL. (Rivinus, 1690), so called because reputed a remedy for scrofula, or perhaps on account of the knots on the roots resembling scrofula; < L. *scrophula*, scrofula; see *scrofula*.] A genus of gamopetalous plants, type of the order *Scrophulariaceæ*, belonging to the tribe *Cheloneæ*. It is characterized by flowers with a deeply five-cleft calyx, a nearly globose corolla with four short, flat, erect lobes and one spreading in front, four stamens with one-celled anthers, and often a scale-like staminode representing a fifth stamen. The fruit is a rigid two-celled septifid capsule, roundish and commonly sharp-pointed, containing very numerous wrinkled seeds. There are about 120 species, chiefly Old World plants of the Mediterranean region, also extending widely through the north temperate zone, but very sparingly in America, where 3 species occur in the western United States, one of which, *S. nodosa*, figwort, extends to the Atlantic and to Canada. They are smooth or bristly herbs, sometimes shrubby, often fetid. They bear leaves which are chiefly opposite, and are often covered with pellucid dots, and loose cymes of greenish, purplish, or yellow flowers disposed in a terminal thyrsus. The species are known as *figwort*, especially *S. aquatica* of England, also called *water betony*, *bullwort*, and *bishop's-leaves*, and *S. nodosa*, a widely diffused species of Europe and America, used formerly in medicine in the treatment of scrofula, and occasionally still in making ointments for ulcers, etc. See *breastwort*.

Scrophularineæ (skrof'ū-lā-rin'ē-ē), *n. pl.* [NL. (Bentham, 1835), < *Scrophularia* + *-inæ*.] An important order of gamopetalous plants, of the cohort *Personales* in the series *Bicarpellata*, distinguished by a completely two-celled ovary with its placenta on the middle partition, and by numerous seeds with fleshy albumen. The flowers have usually a persistent five-lobed calyx, a personate and irregularly inflated two-lipped corolla, four didynamous stamens borne on the corolla-tube, often with a staminode representing a fifth stamen, and an entire and sessile ovary which becomes a capsule opening by lines or terminal chinks, or rarely succulent and forming a berry. The order includes about 2,000 species, of 166 genera and 12 tribes, by many grouped in 3 series—the *Pseudobombaceæ*, with alternate leaves and flattish flowers, as the mullein, transitional to the *Solanaceæ* or nightshade family; the typical section, the *Antirrhinoideæ*, as the snapdragon, with opposite lower leaves and the upper lip exterior in the bud; and the *Rhinanthoideæ*, including the foxglove and *Gerardia*, with various leaves and the lower lip exterior. The species are mainly herbs—a few, as *Paulownia*, becoming trees. Their leaves are entire or toothed, seldom lobed, and always without stipules. The inflorescence is either perfectly centripetal, commonly racemose, or primarily centripetal, the branches however bearing centrifugal clusters, either axillary or forming together a thyrsus. In some exceptional genera the corolla is spreading and nearly flat (see *Veronica*, *Verbascum*, *Limonella*); in many others the typical personate form becomes altered to a funnel-shaped or bell-shaped body, or to an inflated pouch or sac, often with a conspicuous spur. The order is well distributed through all parts of the world; it is most frequent in temperate and montane regions, but is also found within both arctic and tropical climates. About 50 genera are peculiar to America, over half of which belong to North America only; about 23 are confined to South Africa, 15 to Asia, and the others are mostly more widely diffused; 3 genera and about 340 species occur in the United States—one, *Veronica*, extending within the arctic circle. Most species are acid and bit-

ter, and of suspicious or actively poisonous properties; many, as *Scrophularia* (the type), *Franseria*, etc., yield remedies formerly or at present in repute. Several genera, as *Buchnera* and *Gerardia*, show a marked tendency to parasitism, dry black, resist cultivation, are in various species leafless, and connect with the parasitic order *Orobanchaceæ*. Others yield some of the most ornamental flowers of the garden. For the principal types of tribes, see *Verbasum*, *Calceolaria*, *Antirrhinum*, *Chelone*, *Gratiola*, *Digitaria*, *Gerardia*, and *Euphrasia*. The purse-like tegumentary investment of the testes and part of the spermatic cord; the cod. The scrotum is a double bag, whose two cavities are separated by the septum scroti, which is indicated on the surface by a median seam or raphe. It consists of two layers—the skin, or integumentary layer, and the contractile layer, or dartos. The integument is very thin, brownish, provided with hairs and sebaceous follicles, and more or less corrugated or rugose, owing to the contraction of the dartos, which is a vascular layer containing a large amount of non-striated muscular tissue. All mammals whose testes leave the abdominal cavity have a scrotum, but in position, as well as in other particulars, it differs much in different cases. It is perineal, as in man, monkeys, dogs, etc.; or inguinal, as in the horse, bull, etc.; or abdominal, as in marsupials, in the position of the mammary pouch of the female. It may be sessile and little protuberant, or pendulous by a narrow neck, as in the bull, marsupials, etc.—**Raphe of the scrotum**. See *raphe*.

The presence of scutella upon the back of the tarsus constitutes scutellipantation—a condition rare in oscine birds, though usual in non-oscine *Passeres*, in *Picariæ*, etc. Also written *scutella*, with a plural *scutellæ*.—**Abdominal scutella**, distinct scutellum, received scutellum. sea-breeze (sē'brēz), *n.* A breeze blowing from the sea toward the land; specifically, in *meteor.*, a diurnal breeze felt near the sea-coast, setting in from the sea about 10 A. M., reaching its greatest strength from 2 to 3 P. M., and dying away about sunset. The sea-breeze and the corresponding land-breeze together constitute a local and-circulation due to the heating of the land above the ocean temperature during the day and the cooling below it during the night. The upper strata of the air that have become heated and expanded flow off seaward, and produce an increased pressure a short distance from the land. This increment of pressure initiates the sea-breeze, which extends a few miles inland, with a strength depending on the temperature-gradient and on the local topography. Hence it is most strongly marked in equatorial and tropical regions, where the diurnal range of temperature and the contrasts between ocean and land temperatures are greatest; but traces of it have been found even in arctic regions. Steep slopes and mountain-ranges near the coast intensify the sea-breeze by increasing the energy of convection-currents, which in turn create a demand for a greater local surface in-draft. By balloon observations the depth of the sea-breeze at Coney Island has been found to be between 300 and 400 feet. It is mainly the daily sea-breeze which renders the summer climate of the sea-shore markedly invigorating and refreshing.

sea-trumpet (sē'trum'pet), *n.* 1. A mediæval
musical instrument essentially similar to the

sisted of a wooden body about 6 feet long that in front,
polygonal behind, and tapering from a somewhat large
flat base, which could be rested on the floor, to a short
thick neck terminating in a head with a tuning-screw.
It had but one large string, made of gut, stretched over
a peculiar bridge, and tuned to a low pitch usually about
that of the second C below middle C. The bridge was
made so as to rest firmly on only one foot, the other leg
being free to vibrate upon the body. The instrument was
played with a large bow, like that of a violoncello. The
tones used were the natural harmonies of the string, pro-
duced by lightly touching the nodes. Its scale therefore
coincided with that of the trumpet, and this fact, taken
in connection with its general shape, probably suggested
its name. It was used for both sacred and secular music,
both alone and in sets of three or four. It was especially
common in nurseries as an accompaniment for singing,
since its tones corresponded in pitch with those of the
female voice. The latest specimens date from early in
the eighteenth century. The instrument is important in
connection with the development of the viol. Also *na-
rue trumpet*, *tromba marina*, *marin'siddle*, etc.

Of a second class or group; second, not merely as so counted, but in its own nature; appropriately reckoned as second; fulfilling a function similar to that which is primary, but less important; opposed to *primary* or *principal*. That which is secondary, properly speaking, differs from anything subsidiary or subordinate in that the latter only serves to enable the primary to full its function, while the secondary thing fulfills a similar but less important function. Thus, a subsidiary purpose is a means to an ultimate end; but a secondary purpose or end is a weaker motive reinforcing a stronger one.

The secondary qualities are properly fourteen in number — namely, heavy and light, dense and rare, thick and thin, hard and soft, sticky and friable, rough and smooth, coherent and slippery. Color, smell, and taste are also secondary qualities. (b) In *modern philos.*, since Galileo (who in 1623 calls the qualities known as primary "primi accidenti") and Boyle (who in 1666 uses the term "secondary qualities, if I may so call them," in precisely the modern signification), affections of bodies; affective, patible, sensible qualities; imputed qualities; qualities of bodies relative to the organs of sense, as color, taste, smell, etc.; opposed to those characters (called *primary qualities*, though properly speaking they are not qualities at all) which we cannot imagine bodies as wanting. Sometimes called *secondary properties*.

Same as *Mesozoic*, a word introduced by John Phillips after *Paleozoic* had become current. *Paleozoic* and *Mesozoic* are now terms in general use; but *Cenozoic*, corresponding to *Tertiary*, is much less common. *Secondary* as at present used by geologists has a quite different meaning from that which it originally had when introduced by Lehmann, about the middle of the eighteenth century. According to his classification, all rocks were divided into primitive, secondary, and alluvial. This classification was improved by Werner, who intercalated a "Transition series" between the primary and the secondary. See *Mesozoic*, *Paleozoic*, *Tertiary*, and *Transition*.

culture (a reflection of Illiger's genus *Gypogonanus*) indicates the long legs like those of a gallinaceous bird; *Serpentarius*, *Ophiobates*, and *reptileus* describe the bird's characteristic habit of feeding upon snakes. Most of the remaining designations are place-names (one of them, *philipensis*, a blunder). The systematic position of this isolated type has been much discussed. It has usually been put in the *Raptores*, as a member of either of the families *Falconidae* or *Vulturidae*, or as forming a separate family called *Serpentariidae* or *Gypogonariidae*. Cuvier put the bird among waders, next to the boat-billed herons (*Ciconiinae*). The late Dr. H. Schlegel of Leyden thought it was a goshawk, and called it *Astur secretarius*. The expert of the British Museum in the latest official lists locates it next to the caracara (which is transferred to the family *Falconidae* on the strength of the supposed relationship). The appearance of the secretary-bird is somewhat suggestive of the hoatzin (see cuts under *hoatzin* and *Opisthocomus*). It is about 4 feet long from the tip of the bill to the end of the tail; the wing from the carpal joint to the point measures 25 inches; the tail is about as long as this, the tarsus 13½ inches. The general color is ashy-gray; the flight-feathers, the feathered part of the legs, and the lower belly are black; the breast and under wing- and tail-coverts are whitish, more or less shaded with ashy; the two middle tail-feathers are longer than the rest, white-tipped, and with subterminal black bar. There is a bare orange-yellow space about the eyes; the iris is hazel; the shanks are flesh-colored. The long crest of black or gray black-tipped feathers springs from the hindhead and nape; these feathers are somewhat spatulate, and dispart when the crest is erected under excitement. The serpent-eater has a very capacious gullet and crop, capable of holding at once several snakes two or three feet long; it also eats other reptiles, as lizards, frogs, toads, and young tortoises. It is said to attack large serpents by grasping them in its talons and striking blows with the wings until it can deal a decisive thrust with the beak upon the head of its prey. The bird has often been tamed by the Dutch colonists, and kept to rid their premises of vermin.

secretion (sē-kret'shon), *n.* [*< OF. secretion, F. secrétion = Sp. secreción = Pg. secreção = It. secrezione, < L. secretio(n-), a dividing, separation, < secretare, pp. secretus, separate: see secret, conceal.*] 1. In physiol.: (a) In animal physiology, the process of preparing and separating substances by glandular activity. The product or secretion usually consists of substances previously existing in the blood, such as water, salts, etc., combined with others which have been elaborated by the glandular epithelium from more or less different substances in the blood. The secretion may be eliminated from the body as detrimental, as urine, or it may be used, as the digestive secretions, to serve requirements of the organism or (as the milk) those of its offspring. Secretions which are merely eliminated as detrimental are called *excretions*. The act of secreting seems, in most instances at least, to be a vital act of the glandular epithelium, and is often, if not always, under direct nervous control. (b) In vegetable

physiology, the process by which substances are separated from the sap of vegetables. The descending sap of plants is not merely subservient to nutrition, but furnishes various matters which are secreted or separated from its mass, and afterward elaborated by particular organs. These secretions are exceedingly numerous, and constitute the great bulk of the solid parts of plants. They have been divided into—(1) *general* or *admixtious secretions*, the component parts of which are gum, sugar, starch, lignin, albumen, and gluten; and (2) *special* or *non-admixtious secretions*, which may be arranged under the heads of acids, alkalis, neutral principles, resinous principles, coloring matters, milks, oils, resins, etc.

sect¹ (sekt), *n.* [*< ME. secte (= D. sekte = MLG. secta, secte = MHG. secte, G. secte, sekte = Sw. Dan. sekt, < F. or L., < OF. secte, F. secte = Pr. Sp. secta = Pg. secta, scita = It. setta, a sect in philosophy or religion, < LL. secta, a sect in philosophy or religion, a school, party, faction, class, gild, band, particularly a heretical doctrine or sect; in ML. in general a following, suite, a suit at law, a part, train, series, order, suit of clothes, etc.): L. secta, a school or set of doctrines (in philosophy), in earliest use a mode of life, a way, most fre-*

quently in the phrase *sectam (alienus) sequi* or *persequi*, 'follow (some one's) way' (whence *sectum (alienus) secuti*, 'those following (some one's) way'; one's party, sect, or faction), where *secta* is prop. 'a way, road,' lit. 'a way cut through,' being orig. pp., *secta* (se. via, way), fem. of *sectus*, pp. of *secare*, cut, as used in the phrase *secare viam*, take one's way, travel one's road, lit. 'cut one's way' (cf. Gr. *τεμεν ὁδόν*, cut one's way, take one's way); see *seccant*, *sect²*, *section*. Cf. *ML. rupta*, a way, road, orig. a road broken through a forest: see *route*, *route*, *rut*. The *L. secta* has been explained otherwise: (a) According to Skeat and others, lit. 'a follower' (= Gr. *ἑπείγης*, a follower), with formative -*ta*, < *sequi* (√ *sequ*, sec- as in *secundus*, etc.) (= Gr. *ἑπείδα*), follow: see *sequant*. But *secta* is never used in the sense of 'follower,' and the phrase *sectam alienus sequi* cannot be translated 'follow some one's follower.' (b) *L. secta*, lit. 'a following,' formed from *sequi* as above; but this is equally untenable. The notion of 'a following,' however, has long been present in the use of the word, as in the *ML.* senses: see above, and cf. *sectator*, *suit*, *suite*, ult. < *L. sequi*, follow. (c) The notion that *L. secta* is lit. 'a party cut off,' namely from the true, orthodox, or established church, and thus implies schism and heresy (cf. *sect²*), is entirely groundless. Cf. *sept¹*. 1. A system or body of doctrines or opinions held by a number of persons and constituting the distinctive doctrines of a school, as propounded originally by the founder or founders of the school and (usually) developed or modified by later adherents; also and usually, the body of persons holding such doctrines or opinions; a school of philosophy or of philosophers: as, the *sect* of Epicurus; or the *sect* of the Epicureans.

As of the secte of which that he was born

He kept his lay, to which that he was sworn.

Chaucer, *Squire's Tale*, I. 10.

The academicks were willing to admit the goods of fortune into their notion of felicity; but no sects of old philosophers did ever leave a room for greatness.

Dryden.

When philosophers in after-times embraced our religion, they blended it often with the peculiar notions of those sects in which they had been educated, and by that means corrupted the purity and simplicity of the Christian doctrine.

Ep. Atterbury, *Sermons*, I. iv.

2. A party or body of persons who unite in holding certain special doctrines or opinions concerning religion, which distinguish them from others holding the same general religious belief; a distinct part of the general body of persons claiming the same religious name or origin; especially, such a party of innovators, differing in their beliefs from those who support the older or orthodox views; a party or faction in a religious body; a separate ecclesiastical organization; an ecclesiastical denomination: as, the *sects* of the Jewish religion (which were not separately organized); the *sects* of the Christian church (usually separately organized); Mohammedan *sects*; Buddhist *sects*. The Latin word *secta*, from which the English word *sect* is derived, did not at first become limited in Christian usage to a specific meaning. It was used for 'way,' 'mode of life,' etc., but also for the Greek *αἵρεσις* (Latin *heresis*, the original of the English word *heresy*), signifying 'a school of philosophy, opinion, or doctrine,' especially peculiar or erroneous doctrine. A familiar application was to the sect of Christians, as distinguished from Jews and pagans. In four of the nine passages in which *αἵρεσις* is found in the New Testament, the Vulgate has *heresis*, in the other five *secta*. In Acts xxiv. 14 it has 'the way (*sectam*) which they call heresy (*heresim*).' The use of *secta* in these passages led to the meaning of 'a separate or heretical body,' which is found in writers of the fourth century, and by desynonymization *secta* emphasized the organization and *heresis* the doctrine. Afterward it came to be supposed that the word *secta* meant, etymologically, 'a party cut off'; hence the more or less obnoxious use of *sect* by many writers. It is often used, however, unobnoxiously, in a sense substantially identical with the original sense, to signify 'a body of persons who agree in a particular set of doctrines.'

—4. A representation of an object as it would appear if cut by any intersecting plane, showing the internal structure: a diagram or picture showing what would appear were a part cut off by a plane supposed to pass through an object, as a building, a machine, a biological structure, or a succession of strata. It may be obtained by a *longitudinal section*, usually presents the object as cut through its center lengthwise and vertically, a *transverse section*, as cut acrosswise and vertically, and a *horizontal section*, as cut through its center horizontally. *Oblique sections* are made at various angles. Sections are of great importance in geology, as it is largely by them that the relations and positions of the various members of the different formations, both stratified and unstratified, are made intelligible. The geological structure of any region is best indicated by one or more cross-sections on which the groups of rocks are represented in the order in which they occur and with the proper dips, as well as the irregularities due to faults, crust-movements, and invasions by igneous masses, by which causes the stratigraphy of a region may be made so complicated and obscure as to be unintelligible without such assistance to its comprehension as is afforded by cross-sections.

5. A thin slice of an organic or inorganic substance cut off, as for microscopic examination.

—6. In *zool.*, a classificatory group of no fixed grade or taxonomic rank; a division, series, or group of animals; used, like *group*, differently by different authors. Sections, cohorts, phalanges, tribes, etc., are frequently introduced between the family and the order, or between the family and the genus, but it is commoner to speak of *sections* of a genus (*d. v. subgenera*). The sense corresponds to that of the word *ecop* as much used by French zoologists. The sections of many English entomologists often correspond to families as they are understood in continental Europe and the United States.

7. In *bot.*, a group of species subordinate to a genus; nearly the same as *subgenus* (which see).—8. In *fort.*, the outline of a cut made at any angle to the principal lines other than a right angle.—9. Sedum (sē'dum), *n.* [NL. (Tournefort, 1700), *< L. sedum, houseleek.*] 1. A genus of petaloid plants, of the order *Crassulaceae*. It is characterized by flowers with a four- or five-lobed calyx, the same number of separate petals, twice as many stamens alternately adnate to the petals, and a number of small scales inserted beneath the four or

five ovaries, the latter containing numerous ovules and ripening into separate follicles. There are about 150 species, natives of north temperate and frigid regions, rare in America, where one occurs in Peru, and in the United States 16 or more, chiefly in the mountains, with 3 others naturalized in the east. They are usually smooth herbs, either erect or decumbent, often tufted or moss-like, and remarkable for their fleshy stems and leaves. The latter are of very varied shapes, usually entire or but slightly toothed, and either opposite, alternate, or whorled. The flowers are borne in cymes, usually white, yellow, or pink, sometimes purplish or blue. Many species are common in dry, barren, or rocky places where little else will grow. The 10 British species and some of the American are known as *stonecrop*. Many others, known in cultivation by the generic name, and favorites for ornamenting rockwork, filling vases, and covering walls, are valued for the permanence of their foliage, which resists drought. Several with stiff rosettes of thick leaves are used for bedding out in summer, or employed for decorative borders and to form permanent designs, mottos, and lettering. Many similar Mexican plants so used, and commonly confused with these, belong to the subgenus *Echeveria* of the related genus *Cotyledon*, and are distinguished by their united five-furrowed corolla-tube. A similar habit occurs in the related genus *Semperflorens*. Several other species are in cultivation for their pink, purple, or scarlet flowers, and others for their variegated leaves mottled with white or yellow. A few are dioecious, and have flat, thinner leaves, forming the subgenus *Rhodiola*, the *rhodiola* of medieval shops. (See *rosemary* and *heart-all*.) Many species are remarkable for persistence of life, cut stems growing and even flowering when fastened on a wall, deriving nourishment from reserves in their lower leaves and succulent stem, especially *S. telephium* (for which see *orpine*), also called *live-for-ever* and *livealong*, and known as *Adam's-cud* because sometimes growing when pressed and apparently dried, and as *midsummer-men* because formerly used for divination on midsummer eve by setting up two stems to see if the one representing the lover will turn to the other. *S. acre*, the English wall-pepper, bird's-bread, creeping jack, or pricklet, an emetic and cathartic, is often cultivated in America as *moss*, *golden-moss*, or *love-entangle*, and *S. Sieboldii*, a Japanese species valued for its grayish-green whorled leaves, as *condyneris*; *S. rupestre* is known in England as *jealousy*; and for *S. Andropogon*, see *herb of friendship*, under *herb*. *S. album*, formerly esteemed in medicine and eaten cooked or as a salad, is known as *worm-grass* and *prickmand*. *S. pulchellum* of the southern United States is sometimes cultivated under the name of *widow's-scissors*. *S. ternatum*, the wild stonecrop of rocky places in Pennsylvania and southward, with white flowers and rounded ornamental leaves in threes, is also often cultivated. *S. telephium*, from the Potomac southward, and the rose-croft, in the Rocky Mountains and arctic America, are conspicuous on account of their growth in multitudes on high ledges of dry mountain-cliffs.

2. [*l. c.*] A plant of the genus *Sedum*: extended by very early writers to the houseleek and other crassulaceous plants. Sometimes written *cedum*.

With water, and on nyght thil seede the stepe,
And beestes wicke away thus may me kepe.

2. The seat of a bishop, whether an ordinary bishop, or a bishop of higher rank (metropolitan, etc., patriarch, pope); the local center of a diocese and of diocesan authority, or of a diocese and other subordinate dioceses; the city or locality from which ecclesiastical jurisdiction is exercised; hence, episcopal rank, authority, and jurisdiction as exercised from a permanent local center. The word *see*, from meaning any seat of dignity, came to apply specifically to the cathedra, or episcopal throne, situated in a cathedral, thence to the city which contained the cathedral and was the chief city of a bishop's diocese, and so in modern usage to the diocese itself. It differs from *diocese*, however, in that *diocese* represents the territorial province for the care of which the bishop is responsible (that is, where his duties lie), whereas *see* is the local seat of his authority, dignity, and episcopal privileges. Both words differ from *bishopric*, in that *bishopric* represents the bishop's office, whether actual or nominal. See *throne*.

The church where the bishop is set with his college of presbyters about him we call a *see*.

The fertilized and matured ovule of the higher or flowering plants. It is a body within the pericarp or seed-vessel, containing an organized embryo, or nucleus, which, on being placed under favorable circumstances, develops into an individual similar to that from which it came. The reproductive bodies of the lower or flowerless plants (cryptogams) differ in their mode of germination and in other ways, and are not called true seeds, but *spores*. (See *spore*.) The seed-coats are those of the ovule—two, or rarely only one. The outer, answering to the pericarp, is the more firm and is not rarely crustaceous in texture, and takes the name of *testa* (also *spermoderm* and *episperma*). The inner, answering to the secundine, is called *tegmen* (sometimes *endopleura*); when present, it is always conformed to the nucleus, and is thin or soft and delicate in texture. The seed-stalk or podosperm, when there is one, is the pedicel or attachment of the seed to the placenta, and answers to the funiculus of the ovule. The chalazae, raphe, and hilum of the ovule retain the same names in the seed. The foramen of the ovule is called the *micropyle* in the seed. The terms which denote the position of the ovule, such as *orthotropous*, *anatropous*, *amphitropous*, etc., also apply equally to the resulting seed. The nucleus may consist of the embryo alone, or of the embryo and the albumen, which is the nourishing substance upon which the developing plant is to feed until it is capable of maintaining itself. See the various terms, and cuts under *anatropous*, *campylotropous*, *Cruciferae*, *ovary*, and *plumule*.

= **Syn. 2.** *Seem, Look, Appear.* *Look* differs from *seem* only in more vividly suggesting the use of the eye, literally or figuratively: as, it *looks* (or *seems*) right. *Appear* is somewhat stronger, having sometimes the sense of coming into view or coming to seem. Each may stand for that which is probably true, or in opposition to that which is true: not to *seem*, but to be; the *seeming* and the *real*. *Should seem* and *would seem* are equally correct, but differ in strength. To say that a thing *should seem* to be true is to say that it ought to seem so or almost necessarily seems so; to say that it *would seem* true is to say that, while there are reasons for holding an opposite view, the preponderance of evidence is on the side of its being true.

The sovereignty was at *see-saw* between the throne and the parliament—and the throne-end of the beam was generally uppermost.

W. Wilson, Congressional Government, vi.

Especially — (a) A circular definition or proof; the definition of a word or thing by means of another which is itself defined by means of the first; the proof of a proposition by means of a premise which is itself proved from the first proposition as a premise.

The ancients called the circular definition also by the name of diallelon, as in this case we declare the definition and the definition respectively by each other. In probability, there is a similar vice which bears the same name. We may, I think, call them by the homely English appellation of the *see-saw*.

Segholates have a monosyllabic primitive form with one short vowel (ā, i, ū), belonging usually to the first radical. By giving the second radical a short seghol as helping vowel, the form becomes dissyllabic. segment (seg'ment), *n.* [= F. *segment* = Sp. *Pg. segmento* = It. *segmento*, *semmento*, < L. *segmentum*, a piece cut off, a strip, segment of the earth, a strip of tinsel. ML. in geom. (tr. Gr. *τμήμα*) a segment, < *seaire*, cut; see *seant*, and cf. *section*, *sector*.] 1. A part cut off or marked as separate from others; one of the parts into which a body naturally divides itself; a section: as, the *segments* of a calyx; the *segments* of an orange; the *segments* of a leaf. Specifically, in *zool.* and *anat.*: (a) One of the rings, somites, or metameres of which the body of an animal is theoretically or actually composed, as an arthromere of a worm or crustacean, or a diarthromere of a vertebrate. See cuts under *Callinorpha*, *Cephalic*, *Podophthalmia*, *præstomium*, and *prænotus*. (b) One of the three primary divisions of either fore or hind limb of a vertebrate, corresponding to the parts known in man as the upper arm, forearm, and hand, or the thigh, leg, and foot. II. **trans.** To separate or divide into segments: as, a *segmented* eel.

segmenta, *n.* Plural of *segmentum*.

segmental (seg'men-tal), *a.* [< *segment* + *-al*.]

1. Having the form of the segment of a circle; being a segment: as, a *segmental* arch. —

2. Of or pertaining to segments or segmentation: as, a *segmental* formula; *segmental* parts; *segmental* organs. — 3. Specifically, in *embryol.*,

noting the primitive and rudimentary renal organs which occur in all vertebrates and some invertebrates, consisting in the former of branched tubules opening at one end into the somatic cavity and at the other by one or more main ducts into the cloaca or hindgut. The segmental organs of a vertebrate are divisible into three parts, anterior, middle, and posterior. The foremost is the head-kidney or *pronephron*, whose duct becomes a Mullerian duct. The next is the Wolffian body proper, or *mesonephron*, whose duct is the Wolffian duct. The last or hindmost is the rudiment of the permanent kidney, whose duct is the ureter; this is the *metanephron*. The epithet *segmental* in this sense was originally used to note the kind of renal or excretory organs which annelids, as worms and leeches, possess, in more or fewer of the segments of the body, whence the name; it was subsequently extended to the above-described embryonic renal organs of vertebrates which are replaced by permanent kidneys — these segmental organs being thus loosely synonymous with *primitive kidney*, *Wolffian body*, and *protonephron*. See cut under *leech*.

segmentally (seg'men-tal-i), *adv.* In a segmental manner; in segments: as, the spinal nerves are arranged *segmentally*.

These organs, being . . . *segmentally* arranged, are termed segmental organs or nephridia.

segmentate (seg'men-tāt), *a.* [< L. *segmentatus*, ornamented with strips of tinsel, lit. having segments, < *segmentum*, a segment; see *segment*.] Having segments; segmented. *Encyc. Brit.*, II. 292.

segmentation (seg'men-tā-shən), *n.* [< *segment* + *-ation*.] The act of cutting into segments; a division into segments; the condition of being divided into segments; the manner in which a segmented part is divided. — **Segmentation cavity**, in *embryol.*, the central space inclosed by the blastomeres of the embryo, before the formation of a gastrula by invagination; the hollow of a blastosphere; a blastocoele. — **Segmentation nucleus**, the nucleus of an impregnated ovum or germ-cell, resulting from fusion of a male and a female pronucleus, and capable of undergoing segmentation. — **Segmentation of the vitellus**, in *embryol.*, *yolk-cleavage*; morulation; the first process of germination of the ovum of any metazoic animal, by which the original single cell of which the ovum primitively consists becomes converted, wholly or in part, into a mass of similar cells, constituting a morula or mulberry-mass. The cells thus formed are specified as *cleavage-cells*, *blastomeres*, or *segmentella*. Segmentation goes on in different cases with some variations, chiefly due to the presence of food-yolk and the position of this yolk relatively to the formative yolk (see *centrolecithal*, *ectolecithal*). Total segmentation is necessarily restricted to holoblastic ova; it is distinguished from the partial segmentation of meroblastic ova (see *holoblastic*, *meroblastic*), the terms meaning respectively that all, or that only some, of the yolk segments. Total segmentation is equal or regular when the whole germ-cell divides into two similar cleavage-cells, and these into four, and so on, the resulting gastrula being the archigastrea. Total segmentation is *unequal* or *irregular* when the cleavage-cells are unlike one another; it results in the amphigastrea. The partial segmentation of meroblastic eggs is always unequal, and either *discoidal* with formation of a discogastrea, or *superficial* and forming a perigastrea. Total equal segmentation is also styled *primitive*, *primordial*, and *plagiometic*, the modifications introduced in unequal and partial segmentation being described as *kenogenetic*. Other terms, descriptive rather than definitive, are used by different

writers; the foregoing is nearly Haeckel's nomenclature. See *egg*, *ovum*, *vitellus*, and cuts under *gastrula* and *gastrulation*. — **Segmentation rhythm**, the rate of production of successive cleavage-cells, or their numerical ratio of increase, whether 2, 4, 8, 16, 32, etc., or any other mode of multiplication. — **Segmentation sphere**, a ball of cleavage-cells; a blastosphere; a morula.

segmented (seg'men-ted), *a.* [< *segment* + *-ed*.] Divided into segments, segmenta, or segmentella; characterized by or exhibiting segmentation; somitic; metameric: thus, the body of a vertebrate is *segmented* according to the number of vertebrae, whether any actual division of parts may be evident or not.

If government, however, throws the expense of coinage, as is reasonable, upon the holders, by making a charge to cover the expense (which is done by giving back rather less in coin than is received in bullion, and is called "levying a *seigniorage*"), the coin will rise to the extent of the *seigniorage* above the value of the bullion. *J. Seines vary in size from one small enough to take a few minnows to the shad seine of a mile or more in length, hauled by a windlass worked by horses or oxen or by a steam-engine. The largest known seine was used for shad at Stony Point on the Potomac in 1871; it measured 3,400 yards, or nearly 2 miles; the lines and seine together had a linear extent of 5 miles, and swept 1,300 acres of river bottom; this net was drawn twice in 24 hours.

To a considerable extent, *seismic* takes the place of *earthquake* used as an adjective or in compound words. Thus *seismic center* is the equivalent of *earthquake center*, etc.—**Seismic area**, the region or part of the earth's surface affected by the shock of an earthquake.—**Seismic center**, or **seismic focus**, the point, line, or region beneath the earth's surface where an earthquake-shock is started or originated.—**Seismic vertical**, the

See *seismometer*.

seismograph (sē'smō-gráf), *n.* [< Gr. *seismos*, an earthquake, & *γράφω*, write.] Same as *seismometer* (which see). The more complicated forms of instruments contrived for the purpose of recording the phenomena of earthquakes are sometimes called *seismographs*, and sometimes *seismometers*. The name *seismograph* was first employed in reference to the elaborate seismometer contrived by Palmieri and used at his station on Mount Vesuvius. This was called by him a "sismografo," and this name has generally been Englished as *seismograph*, which is also the designation most generally applied by the members of the Seismological Society of Japan to the seismometers there contrived and used within the past few years.

seismological (sē'smō-lōj'ik), *a.* [< *seismology* + *-ic*.] Relating to or connected with seismology, or the scientific investigation of the phenomena of earthquakes.

The object of all seismological investigation should be, primarily, to determine both the true direction and velocity of motion of the particles set in motion by the earthquake-wave. Oldham, *Cachar Earthquake*, p. 90.

The labour of collecting and calculating further and future seismologies will be in a great degree thrown away, unless the cultivators of science of all countries . . . shall unite in agreeing to some one uniform system of seismic observation. R. Mallet, in Trans. Brit. Ass. for Adv. of Sci., 1858, p. 1.

seismology (sē'smō-lōj'ī), *n.* [< Gr. *seismos*, an earthquake, & *-λογία*, < *λέγω*, speak: see *-ology*.] The branch of science which has for its object the investigation of the causes and effects of earthquakes, and, in general, of all the conditions and circumstances of their occurrence.

seismometer (sē'smō-mē'tēr), *n.* [< Gr. *seismos*, an earthquake, & *μέτρον*, a measure: see *meter*¹.] An instrument by the aid of which the data are obtained for the scientific study of earthquake phenomena. The forms of instruments used for this purpose are varied, and more or less complicated, in accordance with the wishes and means of the observer. A common bowl partly filled with a viscid fluid, like molasses, which, on being thrown by the earthquake-wave against the side of the bowl, leaves a visible record of the event, is one of the simplest forms of seismometer which have been proposed, as giving a rude approximation to the direction of the horizontal element of the wave. Another simple form of seismometer consists of two sets of cylinders, each set numbering from six to twelve, and the individual cylinders in each uniformly decreasing in size. These are placed on end, one set at right angles to the other, on plates resting on a hard horizontal floor, surrounded by a bed of dry sand, in which the cylinders when overthrown will rest, exactly in the position originally given by the shock. This instrument is theoretically capable of giving the velocity of the horizontal component of the shock, its surface-direction in azimuth, or the direc-

tion of the horizontal component of the seismic wave, and also the direction of translation of the wave. In practice, however, the results given by this simple and inexpensive apparatus have not been found satisfactory. The seismometer now most generally used in large observatories, or those where accurate work is expected, involves Zollner's horizontal pendulum, the use of which was proposed many years ago, but which was put into the present practical form by Messrs. Ewing and Gray. The group of instruments constituting the seismometer of Prof. J. A. Ewing is arranged to give a complete record of every particular of the earthquake movement, by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct pointers on a sheet of smoked glass which is made to revolve uniformly by clockwork, the clock being started by an arrangement similar to that of the Palmieri seismoscope. To this is added another clock which gives the date of the shock and the interval which has elapsed since it took place. Another and simpler form of seismometer designed by Mr. Ewing, and called the "duplex-pendulum seismograph," does not show the vertical element of the disturbance, nor exhibit anything of the relation of time to displacement, but it is in other respects satisfactory in its performance. Of this latter form, fifteen sets were in use in Japan in 1886, and others were being made for other countries. Compare *seismograph*, and see *ent* under *seismoscope*.

Instruments which will in this way measure or write down the earth's motions are called *seismometers* or *seismographs*. Milne, *Earthquakes*, p. 13.

seismoscope (sē'smō-skōp), *n.* [< Gr. *seismos*, an earthquake, & *σκοπεῖν*, view.] A name of the simpler form of seismometer. It is generally so arranged that the exact moment of passage is noted by stopping a clock, either by direct mechanical means or by the use of an electric current. The epoch may also be registered on a revolving cylinder or other similar device. The essential part of a seismoscope usually consists of a delicately suspended or balanced mass, the configuration of which is readily disturbed on the passage of the seismic wave.

To construct an instrument which at the time of an earthquake shall move and leave a record of its motion, there is but little difficulty. Contrivances of this kind are called *seismoscopes*. Milne, *Earthquakes*, p. 13.

3. In *biol.*, the separation of those forms of
 animal and vegetable life which are to survive
 from those which are to perish: the facts, prin-
 ciples, or conditions of such distinction between
 organisms; also, the actual result of such prin-
 ciples or conditions; also, a statement of or a
 doctrine concerning such facts; especially, natu-
 ral selection. See phrases below. **Artificial**
selection, man's agency in modifying the processes and
 so changing the results of natural selection; the facts or
 principles upon which such interference with natural
 evolutionary processes is based and conducted. This has been
 going on more or less systematically since man has domes-
 ticated animals or cultivated plants for his own benefit.
 Such selection may be either *unconscious* or *methodical*
 (see below). It has constantly tended to the latter, which
 is now systematically conducted on a large scale, and has
 resulted in numberless creations of utility or of beauty,
 or of both, which would not have existed had the animals and
 plants thus improved been left to themselves — that is, to
 the operation of natural selection. Examples of artificial
 selection are seen in the breeding of horses for speed, bot-
 tom, or strength, or for any combination of these qualities;
 of cattle for beef or milk; of sheep for mutton or wool; of
 dogs for speed, scent, courage, docility, etc.; of pigs for
 fat pork; of fowls for flesh or eggs; of pigeons for fancied
 shapes and colors, or as carriers; in the cultivation of ce-
 reals, fruits, and vegetables to improve their respective
 qualities and increase their yield, and of flowers to enhance
 their beauty and fragrance. — **Methodical selection**, arti-
 ficial selection methodically or systematically carried on
 to or toward a foreseen desired result; the facts or prin-
 ciples upon which such selection is based, and the means
 of its accomplishment. See above.

Methodical selection is that which guides a man who sys-
 tematically endeavours to modify a breed according to
 some predetermined standard.

Darwin, Var. of Animals and Plants, xx. 177.

In the case of *methodical selection*, a breeder selects for
 some definite object, and free intercrossing will wholly
 stop his work. *Darwin, Origin of Species*, p. 103.

Natural selection, the preservation of some forms of
 animal and vegetable life and the destruction of others,
 in the natural order of such things, by the operation of
 natural causes which, in the course of evolution, favor
 some organisms instead of some others in consequence of
 differences in the organisms themselves. (a) The fact of
 the survival of the fittest in the struggle for existence,
 which means that those animals and plants which are best
 adapted, or have the greatest adaptability, to the conditions
 of their environment do survive other organisms which are
 less adapted, or less capable of being adapted, to such
 conditions. This fact rests upon observation, and is un-
 questionable. (b) The means by which or the conditions
 under which some forms survive while others perish; the
 law of the survival of the fittest; the underlying prin-
 ciple of such survival, and the agencies which effect that
 result. These seem to be mainly intrinsic, or inherent
 in the organism; and they are correlated, in the most vital
 manner possible, with the varying plasticity of different
 organisms, or their degree of susceptibility to modifica-
 tion by their environment. Those which respond most
 readily to external influences are the most modifiable under
 given circumstances, and consequently the most likely to
 be modified in a way that adapts them to their surround-
 ings, which adaptation gives them an advantage over
 less favored organisms in striving to maintain themselves.

Hence (and this is the gist of Darwinian natural selection)
 — (c) The gradual development of individual differences
 which are favorable to the preservation of the life of the
 individual, with corresponding gradual extinction of those
 peculiarities which are unfavorable to that end; also, the
 transmission of such modified characters to offspring, and
 so the perpetuation of some species and the extinction of
 others — a fact in nature respecting which there is no ques-
 tion, since we know that more species, genera, etc., have
 perished than are now living. (d) The theory of natural
 selection; any statement of opinion or belief on that sub-
 ject, which may or may not adequately reflect the facts in
 the case. Ignorance alike of these facts and of this theory
 has been fruitful of misunderstandings and objections re-
 specting the latter. Some of its supporters have made of
 the theory a cause of the facts which it is simply designed
 to explain; some of its opponents, unconsciously biased
 perhaps by such other extremists, have denied that the
 theory has any validity. Between these extremes, the
 author of the theory states explicitly that it neither origi-
 nates variability, nor accounts for the origin of varia-
 tions, in individuals still less in species; but that, given
 the origination and existence of variations, it shows that
 some of these are preserved while others are not; that
 favorable variations tend to be perpetuated and unfavor-
 able variations to become extinct; that those variations
 which best adapt an organism to its environment are most
 favorable to its preservation; and, consequently, that the

theory of natural selection is adequate to explain, to some
 extent, the observed fact of the survival of the fittest in
 the struggle for existence — that is, natural selection in
 sense (a) above. Natural selection in sense (a) is, of course,
 concerned, is specified as *sexual selection* (see below). The
 facts and principles of natural selection in sense (a) are
 used by man for his own benefit in his treatment of plants
 and animals, come under the head of *artificial selection*
 (see above). An extension of the theory of natural selection
 to the origination (as distinguished from the preserva-
 tion) of individual variations has been named *physical*
selection (see below).

This preservation of favourable variations and the re-
 jections of injurious variations I call *Natural Selection*.
 Variations neither useful nor injurious would not be af-
 fected by *natural selection*, and would be left a fluctuating
 element, as perhaps we see in the species called poly-
 morphic. *Darwin, Origin of Species*, ed. 1881, p. 11.

Natural selection . . . implies that the individuals
 which are best fitted for the complex and in the course
 of ages changing conditions to which they are exposed
 generally survive and procreate their kind.

Darwin, Var. of Animals and Plants, ix. 17.

Physical selection, the law of origin for differential
 changes or modifications in organisms which have arisen
 through the action of physical causes in the environment,
 in habits, etc. It is distinguished from *natural selection*,
 which relates not to the origin but to the preservation of
 these changes. *A. Hyatt* — **Sexual selection**, that pro-
 cess or department of natural selection in which sex is
 especially concerned, or in which the means by which
 one sex attracts the other comes prominently into play.
 Thus, anything which exhibits the strength, prowess, or
 beauty of the male attracts the female, and decides her
 preference for one rather than another individual of the
 opposite sex, with the result of affecting the off-spring
 for the better; and this principle of selection, operative
 through many generations may in the end modify the
 specific characters of animals, and thus become an im-
 portant factor in natural selection.

If it be admitted that the females prefer or are uncon-
 sciously excited by the more beautiful males, then the
 males would slowly but surely be rendered more and more
 attractive through *sexual selection*.

Darwin, Descent of Man (ed. 1881), p. 437.

For my own part, I conclude that of all the causes which
 have led to the differences in external appearance between
 the races of men, and to a certain extent between man
 and the lower animals, *sexual selection* has been by far the
 most efficient. *Darwin, Descent of Man* (ed. 1871), II. 367.

Unconscious selection, artificial selection effected un-
 knowingly, or carried on without system or method; man's
 agency in unmethodical selection, or the result of that
 agency. See the extract.

Unconscious selection in the strictest sense of the word
 — that is, the saving of the more useful animals and the neg-
 lect or slaughter of the less useful, without any thought
 of the future — must have gone on occasionally from the
 remotest period and amongst the most barbarous nations.

Darwin, Var. of Animals and Plants, xx. 169.

element was so called (by Berzelius) because associated with *tellurium* (< L. *tellus*, earth.) Chemical symbol, Se; atomic weight, 79. A non-metallic element extracted from the pyrite of Falun in Sweden, and discovered in 1818 by Berzelius. In its general chemical analogies it is related to sulphur and tellurium. It is found in combination with native tellurium, as in selen-tellurium, with sulphur in selen-sulphur; also in very small quantity in some of the varieties of iron pyrites, and in several rare selenides, as clausenite, or lead selenide, etc. When precipitated it appears as a red powder, which melts when heated, and on cooling forms a brittle mass, nearly black, but transmitting red light when in thin plates. When heated in the air it takes fire, burns with a blue flame, and produces a gaseous compound, oxide of selenium, which has a most penetrating and characteristic odor of putrid horse-radish. Selenium undergoes a remarkable change in electrical resistance under the action of light: hence the use of selenium-cells. See *resistance*, 3, and *photophone*.

self (self), *a., pron., and n.* [Also *Se. self*, *self*; < ME. *self*, *self*, *self*, *self* (pl. *selfe*, *selfe*, *selfe*, *selfe*, *selfe*, later *selfes*; in oblique cases *selfen*), < AS. *self*, *self*, *self*, *self*, *self*, same, self, = OS. *self* = OFries. *self*, *self* = OD. *self*, D. *self* = MLG. *self*, *self*, LG. *self* = OHG. *self*, MHG. *self*, G. *self* (inflected *selber*, etc.), *selbst* (uninflected) = Icel. *sjálf*, *sjálf* = Sw. *själf* = Dan. *selv* = Goth. *silba*, same, self; origin unknown: (a) in one view (Skeat) the orig. form **selba* is perhaps for **seliba*, 'left to oneself,' < se-, si- (Goth. *si-k* = L. *se*, oneself, = Skt. *sva*, one's own self), + *lib-*, the base of AS. *lifa*, be left, *lāf* = Goth. *laiba*, a remnant, etc. (see *leavel*, *life*, *live*).] (b) In another view (Kluge) perhaps orig. 'lord, possessor, owner,' akin to Ir. *selb*, possession; cf. Skt. *patis*, lord, with Lith. *patis*, self; cf. also *own*, *v.*, owner, with the related *own*, *a.*, which in some uses is nearly equiv. to *self*. The use of *self* in comp. to form the reflexive pronouns arose out of the orig. independent use of *self* following the personal pronouns, and agreeing with them in inflection, in AS. as follows: *ic selfu* (ie *self*), 'I self' (I myself), *min selfes*, 'of me self' (of

myself), *mē selfum*, 'to me self' (to myself), *mē selfne*, 'me self' (myself), pl. *wē selfe*, 'we self' (we ourselves), etc.; so *thū selfa* (*thū self*), 'thou self' (thyself), *thū selfes*, 'of thee self' (of thyself), etc., *hē selfa* (*hē self*), 'he self' (himself), *his selfes*, 'of him self' (of himself), etc., the adj. *self* becoming coalesced with the preceding pronoun in the oblique cases *mine*, *my*, *me*, *our*, *thine*, *thy*, *thee*, *your*, *his*, *him*, *her*, *their*, *them*, etc., these being ultimately reduced in each instance to a single form, which is practically the dative *me*, *thee*, *him*, *her*, *them*, etc. (in which the acc. was merged), mixed in part with the genitive *mine*, *my*, *our*, *thine*, *thy*, *your*, etc., these orig. genitives in time assuming the appearance of mere possessives, and *self* thus taking on the semblance of a noun governed by them, whence the later independent use of *self* as a noun (see III.). The reflexive combination *me selfe*, *him selfe* (*selve*), etc., came to be used, as the dative of reference, to indicate more distinctly the person referred to — 'I (for) myself,' 'he (for) him self,' etc., thus leading to the emphatic use. The former (AS. ME.) adj. pl. *-s* has now changed to the noun pl. *-es* (*selves*, as in *walves*, *wives*, etc.). *Itself* and *oneself* retain the original order of simple juxtaposition: *it + self*, *one + self*. In the more common *one's self*, *self* is treated as an independent noun. I. a. 1. Same; identical; very same; very. [Obsolete or archaic except when followed by *same*. See *selfsame*.]

J. Arrowsmith, Paper-Hanger's Companion, p. 82.

II. *pron.* A pronominal element affixed to certain personal pronouns and pronominal adjectives to express emphasis or distinction, or to denote a reflexive use. Thus, for emphasis, *I myself* will write; *I will examine for myself*; *thou thyself* shalt go; *thou shalt see for thyself*; the writing *itself* shall be exhibited. "*myself* will decide" not only expresses my determination to decide, but my determination that no other shall decide. Reflexively, *I abhor myself*; he admires *himself*; it pleases *itself*. *Himself*, *herself*, *themselves* are used in the nominative case as well as in the objective. When the elements are separated by an adjective, *self* becomes a mere noun: as, *my own self*, *our two selves*, *his very self*; so *one's self* for *oneself*. See III.

Now these *yourself*en whether that you liketh.

III. *n.*; pl. *selves* (*selvz*). 1. A person in his relations to that very same person. *Self* differs from *ego* as being always relative to a particular individual, and as referring to that person in all his relations to himself and not merely as given in consciousness.

W. James, Prin. of Psychology, l. 100.

2. A thing or class of things, or an attribute or other abstraction, considered as precisely distinguished from all others: as, the separation of church and state is urged in the interest of religion's *self*.

Tennyson, Locksley Hall.

4. In *hort.*, a flower with its natural plain color; a self-colored flower, as distinguished from one which has become "rectified" or variegated. Compare *self-colored*. (*Self* is the first element in numerous compounds, nearly all modern. It may be used with any noun having an associated verb, or with any participial adjective (in *-ing* or *-ed* or *-en*), or other adjective implying action. It indicates either the agent or the object of the action expressed by the word with which it is joined, or the person on behalf of whom it is performed, or the person or thing to, for, or toward whom or which a quality, attribute, or feeling expressed by the following word belongs, is directed, or is exerted, or from which it proceeds; or the subject of, or object affected by, such action, quality, attribute, feeling, and the like; and the meaning is frequently negative, implying that the relation exists toward self only, not toward others: as, *self-acting*, etc. Most of these compounds are of obvious meaning; only the more important of them are given below (without etymology, except when of early formation). In words compounded with *self*, the element *self* has a certain degree of independent accent, generally less than that of the following element, but liable to become by emphasis greater than the latter.) — By one's *self*. =Syn. *Self-denial, Self-sacrifice, Austerity, Asceticism, self-abnegation, self-forgetfulness.* The italicized words agree in representing the voluntary refusal or surrender of personal comfort or desires. *Self-denial* is to be presumed wise, necessary, or benevolent, unless indication is given to the contrary; it may be the denial of selfishness; it may be not only the refusal to take what one might have, but the voluntary surrender of what one has: it may be an act, a habit, or a principle. *Self-sacrifice* goes beyond *self-denial* in necessarily including the idea of surrender, as of comfort, inclination, time, health, while being also presumably in the line of a real duty. The definition of *austerity* is implied in that of *austerity* in the comparison under *austerity*; it stands just at the edge of that frame of mind which regards *self-denial* as good for its own sake; it pushes simplicity of living and the refusal of pleasure beyond what is deemed necessary or helpful to right living by the great mass of those who are equally earnest with the austere in trying to live rightly. *Asceticism* goes beyond *austerity*, being more manifestly excessive and more clearly delighting in self-mortification as a good in itself; it also generally includes somewhat of the disposition to retire from the world. And show the sense of it without the love. *Pope, Prolog. to Satires*, I. 293.

selfishness (sel'fish-ness), *n.* Selfish character, disposition, or conduct; exclusive or chief regard for one's own interest or happiness. = *Syn.* *Selfishness*, *Self-love*. See the quotations.

Not only is the phrase *self-love* used as synonymous with the desire of happiness, but it is often confounded . . . with the word *selfishness*, which certainly, in strict propriety, denotes a very different disposition of mind. *D. Stewart, Philos. of Active and Moral Powers*, ii. 1.

The mention of *Selfishness* leads me to remind you not to confound that with *Self-love*, which is quite a different thing. *Self-love* is . . . a rational, deliberate desire for our own welfare, and for anything we consider likely to promote it. *Selfishness*, on the other hand, consists not in the indulging of this or that particular propensity, but in disregarding, for the sake of any kind of personal gratification or advantage, the rights or the feelings of other men. *Whately, Morals and Chr. Evidence*, xvi. § 3.

selfism (sel'fizim), *n.* [*self* + *-ism*.] Devotedness to self; selfishness. [Rare.]

Self-love is better than any guilting to make that seeme
gorgious wherein our selves are parties. *Sir P. Sidney, Apol. for Poetrie*.

Self-love is, in almost all men, such an overweight that they are incredulous of a man's habitual preference of the general good to his own; but when they see it proved by sacrifices of ease, wealth, rank, and of life itself, there is no limit to their admiration. *Emerson, Courage*.

Self-love is not despicable, but laudable, since duties to self, if self-perfecting—as true duties to self are—must needs be duties to others. *Maudsley, Body and Will*, p. 106.

Self-love, as understood by Butler and other English moralists after him, is . . . an impulse towards pleasure generally, however obtained. *H. Sidgwick, Methods of Ethics*, p. 77.

We see no reason to suppose that *self-love* is primarily or secondarily or ever love for one's mere principle of conscious identity.
